Dell™ recommends Microsoft® Windows® XP Professional for Business

delivery only. Standard fee \$99 (inc. GST) applies to all systems purchased. A standard delivery fee for Axim X5 is \$64 (inc. GST) per system applies to all orders unless cannot be combined with any other discount/promotion. Dell, the Dell logo, Dimension, Inspiron, PowerEdge, PowerVault, Axim and Evalue are registered trademarks or trademarks of the proprietary interest in the marks and names of others. Microsoft Pocket PC 2003 and Windows are either registered trademarks or trademarks of Microsoft Corporation in the United States and in the United States and other countries. **1. For hard drives**, GB means 1 billion bytes. Accessible capacity varies depending on operating environment. **2. On-site service** and/or party products and software. **3. The AOL Trial Offer** is valid until 30th May 2003. Offer is not available to persons who are AOL Members as at 14 December 2002. Offer does not include offer. The three free months are consecutive months only from the date of registration (maximum 92 days). At the end of the three free months you will automatically be migrated to AOL's (ons charges) at which point your monthly membership fee will commence being charged to your credit card. If you do not wish to continue your membership, you must notify AOL by calling. If then be locked on the final region code selected. The region setting applies to commercial DVD movies only and in no way affects use of DVD media for software applications.

Cover CDs have been checked using McAfee VirusScan 7.0 with the latest virus updates at the time of mastering.

Disc Problems: A large amount of thought and effort goes into compiling the *PC Authority* cover discs. It is very important to us that you get the very best out of the CDs and we constantly strive for this goal. If you experience any problems with installing software supplied on the CDs, please email us at: cd@pcauthority.com.au. Although all CDs are thoroughly checked for errors and viruses, AJB Publishing cannot accept any responsibility for any loss or damage to your hardware, software or data which may occur as a direct or indirect result of using the CDs or the data on them.

Feedback: Your input is always invaluable, so please let us know if there's a particular product that you would like to see included on the CD – we'd love to hear from you!

MOBO MADNESS

It's been a big month in the Labs, but it's all paid off in the end.

Motherboards. The Labs this month is absolutely filled to the brim with them. Not only do we have our massive motherboard Labs, but with all the testing needed for our upgrade feature, the Labs team have been knee deep in components all month. As such, we've hereby dubbed this month 'Australian International Month of the Mobo' in the Labs. Ahh, it all took me back to my Labs days of fiddling with SIMMs, DIMMs and RIMMs, probing BIOSes and hacking the registry to get stubborn drivers and benchmarks to work...

The upgrade feature was actually very interesting to watch unfold. As we took old systems and progressively upgraded them, even we were surprised at some of the results. It really goes to show that for a very reasonable outlay, you can add a good couple of years of life to your PC.

Another lesson that came from the upgrade feature, and a lesson I relearned for myself several weeks ago when I performed an upgrade at home, is the kinds of trouble you can get into when performing upgrades. These days the hardware is of such good quality that it is very rare to find a hardware incompatibility or to have a component fail, but the software side of things can still cause shenanigans. More often than not we found ourselves better off formatting and completely reinstalling Windows and updating all the drivers whenever adding a new component - especially if it's the

'As such, we've hereby dubbed this month 'Australian International Month of the Mobo' in the Labs.'

motherboard. Sometimes Windows can handle a mobo swap, but even now it's still a hit and miss affair. So before you do your mobo wrangling, be sure to back everything up, and be prepared to load a fresh copy of Windows from scratch (and activate it, if necessary).

Also, one reason we decided to run the motherboard Labs along side the upgrading feature is when it comes to deciding which mobo to use, there are so damn many chipsets at the moment, it becomes a bit of an exercise in research and jargon decryption. So we thought it would be great to have all the chipsets broken down in a single feature for reference. It took us 15 pages to get through them all, but the Labs gives a great snapshot of all the options around today.

Overall, this month, Darren, David, Dan and Nirmal have all put in a monumental effort bringing all these components and motherboards together - and worn a deep path in the AJB shag between the Labs and the editorial department in the process. And I don't know about you, but I love the work done by Stu and Phil with the model kit illustrations too.

Finally, the PC Authority Website has been undergoing a process of evolution over the last few months, and new features are being added all the time. If you haven't dropped by for a while, check out www.pcauthority.com.au and see what's new.

COFFEE AND A SLICE OF INTERNET

Notebook in hand, **Valens Quinn** braves a surly waitress and enters an Internet Hotspot.

So I said to the waitress 'can we order some food and get on to the Internet?' She responded with a vapid stare and said she'd send her manager over. A few minutes later her manager appeared saying she remembered some technicians skulking around the café a few weeks ago. That was about the same time they put the Intel Centrino 'Wireless Internet Access Here' sign beneath their outdoor menu, but as for using it, she thought you just 'got on'. And that was it. No colourful step-by-step guides, no photocopied 'how to'. My first visit to a Hotspot was beginning to look rather chilly.

And this was the reason why I was sitting in Place Café in the MLC centre in Sydney's CBD. While there's been a lot of hyperbole about the benefits of Hotspots, I hadn't heard any actual accounts from users who'd tried it. With the help of Keith Rothsay, Toshiba's Pre Sales Technical Support Specialist, a Toshiba Portégé R100, Portégé 3500 and Tecra M1, I was confident that we'd be able to hit a few Hotspots and live to tell about it.

Fortunately it wasn't too difficult to find a place to try it out; around 200 shopping centres, cafés, restaurants, hotels and airport lounges already provide wireless access. All made possible by four wireless Internet service providers (WISPs) – Optus, Telstra, Azure Wireless and Xone. While SkyNetGlobal pioneered public wireless access in Australia, it recently sold its network assets to Telstra – a good indication that we'll see more Hotspots to come. At last count there are more Hotspots in Melbourne; find out exactly where they are from Intel's Website at www.intel.com/apac/eng/products/mobiletechnology/hotspots/finder.htm.

Back at the Place Café, Keith managed to get things rolling. When we entered, our 802.11b (Wi-Fi) equipped notebooks automatically detected the presence of an Optus wireless network. What we didn't understand was how to gain access to the Internet from this connection. Did we need a password from someone at the café? Was there an Optus kiosk in the MLC centre that we needed to visit? After a few minutes, Keith noticed his Internet Explorer browser had automatically redirected to an Optus login page. It was as simple as that. Walk in, select the wireless network you want and your browser will direct you to a login page of the service provider. I opened an account with Optus, gave my credit card details and I was surfing the net. It cost me \$13.20 for a one-off account fee and \$12.10 per hour.

As for transfer speeds, remember that this is an 11Mb/s network, so I was enjoying near-instant Web page browsing. I also downloaded a 26MB file from the Toshiba Website, which took around 19 minutes.

Conscious of the other patrons' stares, I took my notebook for a walk to see how far I could go without losing a connection. I managed to get out onto Pitt Street – about 40 meters from the café – before it disconnected. When I came back into the café, I was redirected to the Optus login page and browsing began again. Simple.

After the café, I wanted to try another service provider. I'd heard

that DefiFrance has Hotspots, so notebook bags over shoulders, we headed to the QVB. Interestingly, when we found the DeliFrance shop, the 'Wireless Internet Access Here' sign was only just noticeable. Still, after sitting at a table,

Windows XP detected an Optus wireless network. After entering my password, we were back online. Keen to try another provider we decided not to stay long at DeliFrance. I did feel guilty about dropping in, using a table to get online and leaving without buying a thing. I'm sure that shops with Hotspots will find a way to deal with the likes of us 'surf and run' types in due course.

The next place I visited was the Greenwood Plaza in North Sydney. It's completely covered by an Xone wireless network. Upon entering, the same thing happened – XP detected a Xone wireless network, allowed me to select it, and I then opened my browser which automatically directed me to the Xone login page. I created an account with Xone – this time thankfully without a sign-in fee, and purchased \$10 worth of credits, which bought about an hour of online time. Browsing speeds were simply excellent, and I downloaded the same 26MB file in just seven minutes while window shopping throughout the plaza. I particularly enjoyed surfing the Net on a bench across from an Internet Kiosk. What surprised me most about my little experiment was how easy it is to use a Hotspot. Provided that you have a notebook equipped with an Intel Centrino processor or a 802.11b capable wireless network card and Windows XP, it should be easy. While you can use other operating systems, you'll have to have wireless networking support installed.

Starting as cynics, both Keith and I were very impressed by our experience. I could genuinely see myself using Hotspots in the future when I need Internet access away from the office. But of course, owning a notebook is the first step to increasing your productivity. With the help of Toshiba, in next month's *PC Authority* magazine we'll be putting together a guide that will not only bring you up to speed on the latest wireless network capable notebooks, it will show you how you can save thousands of dollars on your notebook purchase, explain how to best insure your asset and safeguard your data. In addition, we'll compare the costs and advantages of connecting by Hotspots versus other mobile networks. It's a great tool for justifying a new notebook, so be sure to show it to your boss!

HORIZONS

PC Authority seeks out all the latest news in the world of technology, from local trends to global breakthroughs.

NEXT-GEN 3D CHIPS LOCK HORNS

NVIDIA and ATI unleash their latest beasts into the fray.

NVIDIA and ATI have both upped the ante in the consumer 3D graphics stakes, and are both pushing the platform of bringing the same photo-realistic imagery found in cinema, with films like *Lord of the Rings* and *The Matrix*, to your home PC.

NVIDIA's offering, the new GeForce FX line, is based on the NV35 GPU, and replaces the first generation of the GeForce FX family, the NV30. Three new cards are being released with the NV35: GeForce FX 5900, with the complete feature set and 256MB of DDR RAM, for the enthusiast market; GeForce FX 5600 (NV31), with a slightly cut down feature set and less memory for the mainstream market; and the GeForce FX 5200 (NV34) with a minimal features set for the entry-level market.

All NV35 chips are manufactured using a 0.13-micron process at TSMC, indicating a move back to TSMC from IBM, who NVIDIA turned to earlier this year when TSMC's 0.13-micron fabrication process delivered very low yields.

The NV35 is an entirely different chip

⤴ The new FX range brings real-time cinema-quality realism to the PC

from the NV30, and incorporates a number of significant new features, including a 256-bit memory interface, which brings it up to speed with ATI's earlier Radeon cards. It also sports NVIDIA's CineFX technology, which incorporates full DirectX support with pixel

shader 2.0+ and vertex shader 2.0+. New image quality features are Intellisample, which encompasses a number of improved techniques of dealing with colour, lighting and anti-aliasing, and UltraShadow, which is a new way to generate realistic shadow effects.

These features are all good and well, and represent some very impressive technology, although it will be some time before many of the features are supported in games. Doom III will sport some new DirectX 9 features, although it could well be 2004 before the majority of games utilise them.

ATI's new Radeon 9800 Pro also sports up to 256MB of DDR memory, a 256-bit memory interface, ATI's DirectX 9.0 compatible Smartshader 2.1 for pixel and vertex shaders, and Smoothvision 2.1, featuring improved anti-aliasing and anisotropic filtering techniques.

Review samples of the new GeForce FX and Radeon cards are on their way to the PC Authority Labs, so expect full benchmarks and in depth analysis of all the features next issue.

MICROSOFT FUNKS IT UP

Microsoft shows off more details about its sexy new Windows.

This year's WinHEC (Windows Hardware Engineering Conference) has revealed more features of the upcoming Windows version, Longhorn. The new operating system will feature better support for CD and DVD, a 3D-enhanced user interface and full implementation of digital rights management.

The look and feel of Windows has been given a huge overhaul, drawing inevitable comparisons to Apple's Mac OS X. The interface will take full use of 3D acceleration to add better scalability and smooth transitions, similar to Apple's 3D enhanced Quartz technology, although so far the enhanced effects have only been performed on Windows XP. The UI will also feature multiple tiers, giving the user the option of scaling down the 3D

No, it's not a Mac - HP's Athens PC running Microsoft's upcoming Longhorn release.

effects depending on the level of hardware sophistication.

Still in its concept stage at the moment, Bill Gates's keynote presentation also showed off HP's latest prototype creation, Athens, running the new operating system. Like Longhorn's 3D rendering, the Athens PC is also guilty of encouraging Mac comparisons, featuring a large 23-inch widescreen display and funky design.

On top of that, it goes further than the latest iMacs with a fully wireless keyboard and mouse set up, and a multimedia remote.

Other Longhorn features include support for all DVD writing formats which allow straight-to-disc burning and a new 15-minute install method for loading default Windows installations onto any hardware configuration.

MIXED BAG OF APPLES FOR ITUNES

Apple's new online store has enjoyed yet paid for its success in its opening month.

Apple's new online music store has successfully bridged the gap between subscription services and the Wild West world of file-sharing, racking up a million downloads in its first week. The service allows users to download songs from a growing selection of around 200,000 songs from Sony, Warner, EMI, BMG and Universal, but an already bumpy ride might make them think twice.

Unlike other music download services no subscription fee is required and each track costs US\$0.99, or US\$9.99 for a full album. The tracks, which can only be downloaded through Apple's iTunes music software can then be ported to an iPod, burnt an unlimited amount of times and played on anywhere up to three Macs.

Although its take up has been substantial amongst the relatively small Mac community

reports of piracy threaten to taint the service.

Although relatively benign, the hacks take advantage of Apple's streaming application. Each song can legally be streamed to another system, as long as it doesn't transfer the track. It didn't take long for hacks to appear that enable users to play the tracks over the Internet and then devise a way to capture the stream.

The true test however will come when it leaves its Mac-only sandbox to be released into the big bad world of Windows PCs by the end of the year.

E3 SHOW REPORT

E3 brings another fresh batch of gaming and hardware goodness.

Games are now big business, with revenue exceeding that of the Hollywood film industry, and this year's E3 exhibition in Los Angeles was a celebration of this newfound excess.

Previous years were dominated by the battle of Sony, Microsoft and Nintendo's consoles, but 2003 is the year of portable gaming, with the continued dominance of Nintendo's GameBoy Advance and the expected showing of Nokia's N-Gage mobile phone and Sony's PlayStation Portable (PSP).

Technically, the event was dominated by a significant paradigm shift in PC gaming. For years game engines have constantly lagged behind the hardware developments by a noticeable margin, but this year was dominated by the use of the advanced shading functions that debuted with the GeForce3 and RADEON 8500, and are now standard hardware features. This is likely to drive a hardware upturn as gamers want to play the latest games with the best looks.

It was Valve's Half-Life 2 that dominated the

Valve's Half-Life 2 stole the show with its photo-realistic graphics and real-world physics.

games on show, thanks to an in depth demo by lead developer Gabe Newell, and was the hottest ticket in LA. Where the original Half-Life redefined how we look at in game AI, Half-Life 2 is set to change forever how physics are integrated into games when it is released on the 30th of September this year.

www.e3expo.com

OPENBSD LOSES FUNDING, DOESN'T KNOW WHY

US government pulls funding on security-obsessed Unix operating system.

After a year and a half of government support the OpenBSD project has lost its US\$2m cash injection.

DARPA (Defense Advanced Research Projects Agency), is largely held responsible for the creation of the Internet and has withdrawn its support for the open source Unix variant, OpenBSD. The operating system initially gained the support of the US Department of Defense due to its single-minded goal of producing the world's most secure operating system.

DARPA's official line is that the funding was cancelled 'due to world events and the evolving threat posed by increasingly capable nation-states'. There is some speculation, however, that the funding was pulled due to negative comments made by OpenBSD project leader, Theo de Raadt about the US military and the war in Iraq.

What's most likely to be the case is that the controversial funding, funnelled to the Canadian-based development group (US laws restrict the export and use of cryptographic tools) through the University of Pennsylvania was cut as DARPA could not continue to fund foreign-based projects.

The cut, however, is unlikely to cease development on the project which had been successfully raising funds for several years prior to DARPA's grant. The team has just announced OpenBSD 3.3 and currently the operating system has reported only one security hole off the default configuration since the project began. You can download the latest version free or for a small fee buy a copy burned on CD.

The Choice for Your Complete Network Solution

LINKSYS®
BROADBAND & WIRELESS
www.linksys.com.sg

Simply **Easier**

Wireless-G [802.11g]

WRT54G Wireless-G Router

- All-in-One cable / DSL-sharing Router, 4-port Switch, and Wireless-G (draft 802.11g) Access Point
- Data rates up to 54Mbps - 5 times faster than Wireless-B (802.11b)
- Also interoperates with Wireless-B clients (at 11Mbps)
- Advanced wireless security with WEP encryption, and MAC filtering

WPC54G Wireless-G Notebook Adapter

- High-speed Wireless-G (draft 802.11g) networking for your notebook computer
- Data rates up to 54Mbps - 5 times faster than Wireless-B (802.11b)
- Also interoperates with Wireless-B networks (at 11Mbps)
- Enhanced security - up to 128-bit data WEP encryption

WAP54G Wireless-G Access Point

- Set up a high-speed Wireless-G (draft 802.11g) network in your home or office
- Data rate up to 54Mbps - 5 times faster than Wireless-B (802.11b)
- Also interoperates with Wireless-B networks (at 11Mbps)
- Advanced wireless security with WEP encryption, and MAC filtering

WMP54G Wireless-G PCI Adapter

- Wireless-G (draft 802.11g) connectivity for your desktop PC
- Incredible data rates up to 54Mbps in the 2.4GHz radio band
- Also interoperates with Wireless-B (802.11b) networks at 11Mbps
- Put your PC wherever you want, with no cabling hassle

An increasingly mobile workforce
opens your network up to a host of threats,
both accidental and intentional.

Bring 'em on.

The only place to securely meet the challenges that a mobile workforce brings to a network is at the point where people connect. The HP ProCurve Adaptive EDGE Architecture affordably puts intelligence and control at the edge of the network, giving you the power to easily adapt to future needs as new wired and wireless mobility solutions are implemented.

With industry-standard switches like the HP ProCurve 5300xl series, you can cost-effectively deploy user and security applications at the point of connection. It immediately recognizes the user and the types of services and access they are permitted to have, preventing unauthorized traffic and potential threats.

Free Lifetime Warranty. HP ProCurve offers true free lifetime warranty. HP ProCurve's 'buy once' bundled software and open standards ASIC technology ensures your Investment Protection. To find out more about HP ProCurve's industry-leading total cost of ownership please call: Commander 132 777 or Volante Systems 1800 799 799.

IT'S FREE BUT...

Should Linux restrict the use of DRM? David Kidd looks at the hypocrisy.

Within the next few years, digital rights management (DRM) is going to burst out of a John Hurt-like chest cavity, run across the table, and disappear into the walls.

Like most of *Alien's* Nostromo crew, there's going to be very little we can do about it. We'll know it's there, running around, but we won't see it until it's tearing us apart with a little mini alien head shooting out of its mouth.

Or so a large, vocal portion of the Open Source community thinks. But the real question they're asking is: where's Ripley? Someone has to blast this thing out of the airlock before it reaches Earth, right Linus? Linus?

Linux creator Linus Torvalds, previously absent from the debate, has actually gone and done the opposite. He's given DRM the green light, and although he doesn't support it, he's announced that he wants to 'make it clear that DRM is perfectly ok with Linux!'

According to a controversial post he made this month to the Linux Kernel mailing list, he wants to avoid the moral issues of DRM and focus on creating the perfect OS. 'I'm an "Oppenheimer", and I refuse to play politics with Linux,' says Torvalds, 'I think you can use Linux for whatever you want to – which very much includes things I don't necessarily personally approve of.'

While I think that his comparison to atom bomb researcher Oppenheimer is inappropriate, as this was the same person who later expressed regret over his work, Torvalds' sentiment is still valid. His goal for Linux, as a technical person, is that it becomes the most capable OS out there, not a playing field for a DRM debate. But not everyone feels this way. So what's the problem?

DRM is the general term for implementing measures to control how software and data are used, for example, like preventing MP3s being copied, or securing your financial details at your local bank. For DRM to be effective it needs to be implemented in the OS, as well as hardware, preventing users getting around simple, application-specific measures.

So it's not hard to see that a community of people united under the notion of free access are

feeling threatened. Open Source software advocates are familiar with what they see as something that restricts their freedom to create, improve and distribute good software and DRM is potentially their worst nightmare.

To stop this, many kernel contributors have been suggesting restrictions on DRM at the kernel level by changing policies on how the technology is used. And doesn't the GPL (the distribution license for Linux) say something about embedding keys into the kernel anyway? DRM can't legally be used, right?

Well, firstly GPL is a social and legal issue, not technical so it's best to deal with that elsewhere. In any case, you can't really embed anything in the kernel because you need to distribute the source code — expect some nasty legal cases about this in the future. The kernel restriction is the real meat, and it's on this absurd point that I agree with Torvalds. It's one thing to speak out about the potential draconian uses of DRM, but to limit legitimate use is, well, a lot like DRM.

Linux is supposed to provide a free platform with only one restriction: you must redistribute the source code. As an OS, developers and users are free to do what they want with it and it's this same freedom that provides the momentum for the Open Source movement.

These same freedoms should be extended to users, businesses and governments for the purpose of protecting their own information. This isn't at odds with the GPL and conforms to the original intent of the operation system – to provide a flexible, stable and robust platform.

At its core, it involves imposing limits on what runs on Linux which is as ridiculous as restricting proprietary software from running on it. It's this mentality that is far more offensive to the freedom the Open Source movement has provided than DRM could ever be.

It's not an exclusive club, let's face it, Linux doesn't need any more reasons for people to choose another platform.

WHAT DO YOU THINK?

Do you think that Linux should remain free of DRM? Email me at dkidd@pcauthority.com.au.

In your Dreams

[illegible]

Linux gets trailers

Compared to the very expensive upgrade in the video card and RAM, Linux just had a much better time on the desktop. There's a little more to the comparison being more than adequate for most users' needs, and the relaxing feeling that are hard to put in a box. One of the reasons for Linux's 2 is that it is based on Apple's QuickTime video, and has a few other Linux tools for some time, in reality, this just means you can watch more online or just Linux system, but by making yourself the site, however, this is what Linux desperately needs to help and help of feedback in the weeks.

Empowering People

money as possible from us, but Open Source? Don't make me laugh. . . Microsoft has a right to keep its king code away from people who would make as many versions of Windows as Linux has. One reason many people use Windows is that there is only one Windows. Linux has so many versions and types that nobody knows what to choose! I myself think that Windows XP is an excellent OS that is very stable and reliable.

N Crouch

David Kidd replies:

One of the most prohibitive aspects of Linux's uptake on the desktop is the confusing array of distributions which are often not compatible with each other. Although this makes it hard for developers and users, taking this away would remove its strength in being an adaptable, robust and above all, open platform.

Palmed off

I've been using a Hewlett-Packard Jornada Pocket PC for a couple of years now and have been very pleased with it until I lost my stylus.

I couldn't find a replacement in shops so I rang Hewlett-Packard and was told it was \$11 for a replacement. Plus \$12 freight to ship it from Melbourne to Perth. Plus GST. The grand total for a 5cm piece of black plastic

was \$25. They're not available in the shops for mysterious reasons, but I'm sure I'm not the only person who's lost a stylus.

Now, it's not that I can't afford \$25, but that just seems an outrageous price to me. I mean, honestly, \$11 for a bit of plastic? And how is it getting from Melbourne to Perth costs \$12 for something that weighs a few grams?

This may seem like a big fuss about a small issue, but if I were running Hewlett-Packard/Compaq, I would have thought a satisfied customer who might come back and buy another Pocket PC would be worth the cost of a stylus. Or at least, I'd have them stocked in outlets that sell Pocket PCs. It'll be a Palm for me next time.

D Blythe

Not clear cut

S Rice (Star Letter, June 2003) made a good point about technology controlling us. My opinion, at least in some areas, is a little different.

Regarding his example which suggests that if 56K connection was the fastest you wouldn't want faster, I disagree. If you had a 56K connection, someone would hook two modems up to get a 112K connection. It's proven in the graphic cards and CPU areas – if someone buys the fastest chip speed, someone somewhere

overclocks it to go even faster. This then spurs technology to produce faster chips as it would seem people want them.

And 13-year olds DO care about technology. I know that if I were 13 then yes I wouldn't care if the next MP3 player had a longer battery but if a better audio compression was found, I'd want that so I could carry MORE music.

It isn't such a clear cut question as he seems to make it, as some aspects of technology are just done because they can, and others for real gain.

S Williams

No means no

Tim Dean hit it on the head when writing about 'No junk mail' in his Weblog (www.pcauthority.com.au/index.asp?PageType=ArticleDetai&CatID=9&ID=13278). He's right about the .au addresses – I get more spam promoting American things than anything else. I mean, do I really want to get a mortgage from over there?

What gets me is how do these idiots make any money? None of their return addresses work so you can't reply even if you wanted to. Opt-outs don't appear to work on most occasions.

I did consider a spam filtering service online but then it turned out I had to give them access to my

account. How could I trust them without knowing they would also abuse my email address? I also long for the days when 'No' means no and we don't have to receive rubbish if we don't want it!

K Thomas

Tim Dean replies:

Hear hear. And for more of our blogs, head to www.pcauthority.com.au

Windows? No thanks

In our November, 2002 issue, we awarded T Young a prize for his excellent letter, Black Death.

His letter detailed his new found disdain for Microsoft, ending with the statement that he 'would not accept a Windows XP system if it was free [and would treat] further Microsoft products like the plague.' And our prize for that month?

A Microsoft prize pack. Thanks to EverythingLinux (www.everythinglinux.com.au) we are happy to award T Young, with a boxed copy of SuSE 8.2 Professional, worth \$178.

Subscribe & Save

GET 12 ISSUES FOR THE PRICE OF 8!
GET 24 ISSUES FOR THE PRICE OF 16!

You probably agree that reading *PC Authority* is a smart move. With your personal or professional interest in technology, you know it's a great investment of your time and money.

This month you have the choice to make an even smarter move. Take out a 12-month subscription and you only pay for 8 issues; take it for 2-years and pay for 16. Don't miss out on this chance to upgrade to a subscription and save 39% off your future issues. Every issue of *PC Authority* helps you:

Make the right choices.

PC Authority is jam-packed with the latest products. Product reviews are in depth and everything is comprehensively and objectively evaluated in our labs, using the most respected and reliable testing methodology available. We take the hard work out of choosing and buying technology.

Get more out of technology.

PC Authority is not only about products, but also how to get the most from them. Every issue reveals new ways of working or solutions to tricky technology problems. Working with some of the world's most respected writers, *PC Authority* has a massive 40 pages every month of how-tos, professional advice, tutorials and guides - helping you get the most out of your technology.

Stay ahead of the game.

PC Authority delivers more exclusives and first looks than any other Australian PC magazine. In 2002, *PC Authority* was the first magazine to examine Dell's new PDA, Microsoft's Tablet PC and discovered a new killer bug in Windows XP. Choose the magazine that will keep you ahead of the game.

Reading *PC Authority* helps you make the right choices. Subscribe with this offer and make another one.

P4 MOTHERBOARD

Gigabyte 8PENXP

PRICE: \$582

SUPPLIER: Synnex

1300 880 038

ISSUE: Labs Winner, July 2003, page 77

You might be wondering why the Gigabyte 8PENXP costs \$582. The short answer is it's features.

It has all of them

While this might seem expensive, it's still a lot cheaper than purchasing add-on cards, making it very good value.

NOTEBOOK

Dell Inspiron 8500

PRICE: \$4,599

SUPPLIER: Dell

1300 303 275

ISSUE: Recommended, April 2003, page 38

The inclusion of a GeForce4 4200 Go sweetens the deal considerably and helps this notebook update the definition of the term 'desktop replacement'. The Inspiron 8500 gets away with its bulky design thanks to strong performance.

BUDGET NOTEBOOK

ModTech Civic AS2400DW

PRICE: \$2,499

SUPPLIER: ModTech

(03) 9873 0068

ISSUE: Labs Winner, March 2003, page 38

An outstanding performer packed with excellent features - a desktop 2.4GHz Pentium 4 and DVD/CD-RW combo drive - and the price is nice too.

CATEGORY	PRODUCT	DETAILS	VERDICT
SERVER	Dell PowerEdge 600SC	PRICE: \$3,098; \$4,769 (inc. Windows 2000 Server) SUPPLIER: Dell 1800 812 393 ISSUE: Labs Winner, November 2002, page 83	Dell's PowerEdge range is almost exclusively built for small business users, offering a great fusion between price and performance. The 600SC offers an unbeatable mix of good performance and value for money making this an essential inclusion for any small business network.
DIGITAL SLR CAMERA	Canon 1Ds	PRICE: From \$16,499 SUPPLIER: Canon 1800 021 167 ISSUE: Recommended, May 2003, page 53	The first digital SLR to truly compete with 35mm film SLRs. Superb design make it an extremely versatile package that is built from the ground-up for the needs of the professional photographer.
19IN FLAT-CRT	Sony CPD6420	PRICE: \$1,099 SUPPLIER: Sony Australia 1300 137 669 ISSUE: Labs Winner, July 2002, page 97	This Sony flat-CRT is simply the top choice if you're in the market for a 19in monitor. Rich colour and a fine, crisp image lends the Sony superior image quality, and at the highly competitive price of \$1,099 you can't go wrong.
BUDGET PDA	Palm Zire	PRICE: \$239 SUPPLIER: Palm 1800 350 535 ISSUE: Recommended, January 2003, page 42	It may not have much built-in memory or the fastest processor, but this is a well-built, light and stylish PDA. A bargain at \$239.
HIGH-END 3D CARD	3DLABS WILDCAT VP870	PRICE: \$1,297 SUPPLIER: InterCAD (02) 9975 7133 ISSUE: Recommended, November 2002, page 37	The Wildcat VP870 sets a new standard in affordable workstation graphics. Performance and features are unmatched at this price. If you want uncompromising 3D for design, the VP870 should be at the top of your list.
3D GRAPHICS CARD	ABIT Siluro GF4 Ti4200 OTES	PRICE: \$357 SUPPLIER: BOKERP 1300 665 377 ISSUE: Labs Winner, January 2003, page 66	ABIT went a little nuts with the OTES's heatsink, but it's an exceptional card that delivers great performance for a very reasonable price.
SURROUND SPEAKERS	Klipsch ProMedia 4.1	PRICE: \$749 SUPPLIER: Innovision 1300 785 795 ISSUE: Quality, December 2001, page 60	If you want clear and crisp PC speakers, you can't go past the Klipsch ProMedia 4.1. Fine sound quality with high output levels and low distortion make this set the best we've heard.
SOUND CARD	Sound Blaster Audigy 2 Platinum	PRICE: \$299 SUPPLIER: Creative Labs Australia (02) 9666 6100 ISSUE: Recommended, Dec 2002, page 54	The Audigy 2 offers an amazing array of features, superb sound quality and a great software bundle. It may try to be all things to all people, but it does a fairly decent job of it.

**My office needs desktop PC's
with over 3GHz of power.**

And a 17" monitor.

Oh, and a CD-RW.

**For under \$2,000 would
be nice too.**

Keep dreaming.

Acer

Power is the word. The AcerPower ST desktop gets its 3.06GHz of power from the Intel® Pentium® 4 Processor, which means enough grunt to support future applications requiring that extra kick. Onto features, the AcerPower ST has a 17" monitor for brilliant presentation and viewing and a bonus CD-RW. Now for the price. While this incredible desktop normally costs \$3,321, we've chopped that by 33% to just \$1,999. Still dreaming?

\$1,999 RRP inc GST

Empowering People

A-List: Upgrade guide

Welcome to the Upgrade guide. If you're looking to buy a PC, or perform an upgrade, use this page to set your yardsticks. We have put together specifications for three classes of systems, and broken them down into components and included rough pricing. Changes in

hardware specifications and price each month are highlighted in bold text. Let us know how useful this page is to you, and what kinds of systems you want to see here – email: feedback@pcauthority.com.au.

BUDGET PC

TARGET PRICE: \$2,000

COMPONENT	DETAILS	TARGET SPECIFICATION	PRICE
• CASE	Midi tower	300W+ PSU; 5+ bays, front USB	\$120
• CPU	AMD Athlon XP 2400+	2.0GHz; 256KB L2 cache; 266MHz FSB	\$230
• MOTHERBOARD	VIA KT333 ATX	KT333 chipset; sound; ATA100	\$135
• RAM	512MB PC2700 DDR	333MHz DDR-RAM	\$155
• GRAPHICS CARD	NVIDIA GeForce Ti4200	AGP; 128MB DDR-RAM	\$330
• MONITOR	17in CRT	1,024 x 768 @ 85Hz minimum	\$236
• SOUND CARD	Integrated sound	Integrated on motherboard	\$0
• SPEAKERS	2.1 stereo speakers	2 satellites; 1 sub-woofer; 33W+ RMS	\$99
• HARD DISK	60GB IDE	7,200rpm; ATA100; 2MB cache	\$170
• OPTICAL DRIVE	CD-RW IDE	52 x 24 x 52 CD-RW	\$110
• FLOPPY DRIVE	Floppy drive	1.44MB floppy	\$25
• MODEM	56K modem	V.90 internal PCI	\$40
• MOUSE	Basic mouse	Optical; 2-button; wheel; USB, PS/2	\$45
• KEYBOARD	Basic keyboard	104-key keyboard	\$25
• OPERATING SYSTEM	Windows XP	Home Edition	\$185
• PERIPHERALS	N/A	None	\$0
• WARRANTY	Standard	Three years RTB	\$0
Total			\$1,905

BUDGET PC

Representing the typical home PC, this system is capable of performing a wide range of tasks. It's suitable for Web surfing, office-based applications and playing most games; and it includes a CD-RW drive. At the moment it features a 56K modem, although with the widespread use of broadband internet, you might want to replace it with an Ethernet card, costing about the same amount. Possible upgrades include forking out an additional \$200 or so for a 19in monitor. If you're after home entertainment usage, your next purchase may be a DVD-ROM or better quality budget sound card, which will set you back about \$80.

BUSINESS PC

TARGET PRICE: \$2,000

COMPONENT	DETAILS	TARGET SPECIFICATION	PRICE
• CASE	Slim tower	Micro-ATX; 200W PSU; 2+ bays; tool-less access	\$160
• CPU	Intel Pentium 4 2.4GHz	512KB L2 cache; 533MHz FSB	\$355
• MOTHERBOARD	Intel 845G	i845GE chipset; sound; LAN; ATA100	\$200
• RAM	512MB PC2700 DDR	333MHz DDR-RAM	\$155
• GRAPHICS CARD	Integrated graphics	Integrated on motherboard	\$0
• MONITOR	17in CRT	1,024 x 768 @ 85Hz minimum	\$236
• SOUND CARD	Integrated sound	Integrated on motherboard	\$0
• SPEAKERS	N/A	None	\$0
• HARD DISK	40GB IDE	5,400rpm; ATA133; 2MB cache	\$132
• OPTICAL DRIVE	CD-ROM	52x CD-ROM	\$55
• FLOPPY DRIVE	N/A	None	\$0
• MODEM	N/A	None	\$0
• MOUSE	Basic mouse	Optical; 2-button; wheel; USB, PS/2	\$45
• KEYBOARD	Enhanced keyboard	Ergonomic or extra functions	\$120
• OPERATING SYSTEM	Windows XP	Professional Edition	\$286
• PERIPHERALS	N/A	None	\$0
• WARRANTY	Enhanced	Three years on-site same-day	\$150
Total			\$1,894

BUSINESS PC

Here is a basic specification for a multipurpose business PC. Unlike the home PC, however, a business PC has some very different priorities. Performance is one of them, but more important is reliability, serviceability and warranty. You simply cannot afford the downtime and lost productivity that occurs as a result of a hardware failure. As such, extra has been spent on a slim and easily accessible case with a thorough same-day on-site warranty. This spec only represents the basic hardware, and doesn't include the two other major costs a business PC faces: software and services. Total cost of ownership is the mantra, and the initial hardware cost can only be around 25% of a PC's TCO over its lifespan.

ENTERTAINMENT PC

TARGET PRICE: \$4,000

COMPONENT	DETAILS	TARGET SPECIFICATION	PRICE
• CASE	Midi tower	350W+ PSU; 5+ bays; front USB	\$120
• CPU	Intel Pentium 4 2.66GHz	512KB L2 cache; 533MHz FSB	\$480
• MOTHERBOARD	Intel 845PE	i845PE chipset; LAN; ATA133 RAID	\$290
• RAM	512MB PC2700 DDR	333MHz DDR-RAM	\$155
• GRAPHICS CARD	ATI RADEON 9700 PRO	AGP; 128MB DDR-RAM	\$745
• MONITOR	19in CRT	1,280 x 1,024 @ 85Hz minimum	\$400
• SOUND CARD	PCI sound card	24-bit; 6.1 output; EAX	\$270
• SPEAKERS	5.1 surround	5 satellites; 1 sub-woofer; 45W+ RMS	\$230
• HARD DISK	2x 40GB IDE RAID	7,200rpm; ATA100 RAID; 2MB cache	\$300
• OPTICAL DRIVE	CD-RW/DVD-ROM IDE	52 x 24 x 52 CD-RW; 16x DVD-ROM	\$200
• FLOPPY DRIVE	Floppy drive	1.44MB floppy	\$25
• MODEM	56K modem	V.90 internal PCI	\$40
• MOUSE	Optical mouse	Optical; wheel; USB	\$85
• KEYBOARD	Enhanced keyboard	Ergonomic or extra functions	\$120
• OPERATING SYSTEM	Windows XP	Professional Edition	\$286
• PERIPHERALS	Game device	Joystick/gamepad/wheel	\$150
• WARRANTY	Standard	Three years RTB	\$0
Total			\$3,896

ENTERTAINMENT PC

This system represents a high-end gaming and entertainment PC at a very reasonable price. With the Pentium 4, DDR-RAM and RADEON 9700 PRO, it is about as good as it gets gaming-wise at the moment. The DVD-ROM, sound card and 5.1 channel surround speakers also make it fantastic for DVD viewing or listening to music. All the components are more than adequate to the tasks at hand as they are, but are still offer full upgradeability. Further falling TFT prices mean you can pick up a 17in flat display for around \$300 more. DVD burners are a fantastic option for bulk backup or home movies, albeit a bit pricey – upgrading from CD-RW to a DVD writer will set you back around another \$450.

DIGITAL CAMERA

Minolta DiMAGE 7i

PRICE: \$1,999

SUPPLIER: Hagemeyer 1300 728 606

ISSUE: Labs Winner, June 2003, page 72

With a stylish and strong mag alloy-housed body, the Minolta 7i isn't budget, but at \$1,999 it produces beautiful and accurate results.

DIGITAL VIDEO CAMERA

Sony DCR-TRV50

PRICE: \$3,499

SUPPLIER: Sony Australia

1300 137 669

ISSUE: Labs Winner, February 2002, page 73

A smart mini-DV cam with more features than most, with the added bonus of excellent image quality. Although it was a close call, the DCR-TRV50 got the nod from the panel as the quality DV camera.

DISK UTILITY

PartitionMagic 8

PRICE: \$149.95

SUPPLIER: Marketing Results

(02) 9899 5888

ISSUE: Recommended, February 2003, page 53

Simply the best partition utility on the market and an essential purchase for those who don't already have it. However, while version 8 adds some new features, there aren't enough to fully justify upgrading from version 7.

15-INCH TFT DISPLAY

PolyView CMV 1515

PRICE: \$499

SUPPLIER: Impact Systems

(02) 9621 2999

ISSUE: Excellence, June 2003, page 48

An exceptional display at an unbeatable price that's definitely worth considering for the quality conscious or those on a tight budget.

17-INCH TFT DISPLAY

Samsung SyncMaster 172W

PRICE: \$1,499

SUPPLIER: Samsung (02) 9763 9700

ISSUE: Labs Winner, May 2003, page 71

The SyncMaster 172W took top honours in almost every category of our tests, and rated the highest of all monitors in this Labs. From such auspicious beginnings it's no surprise that we have awarded this widescreen monitor with the title of winner.

ATHLON MOTHERBOARD

Gigabyte 7VXP Ultra

PRICE: \$329

SUPPLIER: Synnex 1300 880 038

ISSUE: Labs Winner, July 2003, page 68

This board supports DDR400, a 333MHz FSB and has SATA and IDE RAID. It also offers six-channel audio with a full complement of I/O connectivity options, and the build

quality is excellent.

VERDICT

MP3 PLAYER

Apple iPod for Windows

PRICE: \$845

SUPPLIER: Apple 133 622

ISSUE: Recommended, November 2002, page 40

Apple's 10GB iPod is one of the best MP3 players available, with large storage capacity, superior audio and file sharing capabilities – and now it's on PC.

FIREWALL

Fortress End Node VPN

PRICE: \$2,629

SUPPLIER: Fortress Networks (03) 9697 4444

ISSUE: Labs Winner, November 2002, page 98

Out of all the firewalls we looked at, the Fortress End Node VPN came out on top. The attention to detail in its configuration options, the ability to micromanage all aspects of the firewall and the richness of its reporting engine were superb. A definite must-have for network security.

IMAGE EDITING

Adobe Photoshop 7.0

PRICE: \$1,599 full package; \$349 upgrade;

\$589 educational

SUPPLIER: Adobe 1300 550 305

ISSUE: Recommended, July 2002, page 61

Yet again Adobe has replaced its predecessor with revolutionary, rather than evolutionary changes. With enhanced visual management, creative new brush handling and improved Web capabilities, Photoshop retains its title as the ultimate image editing program.

ANTIVIRUS

Norton AntiVirus 2003

PRICE: \$109.95

SUPPLIER: Symantec (02) 8879 1000

ISSUE: Labs Winner, October 2002, page 97

When it comes to antivirus, you not only need a top-performing product, but also one that is easy-to-use, with frequent seamless updates and protection for a variety of possible entry points. Norton AntiVirus 2003 is the pick of the bunch with its excellent user friendly interface and top performance.

WEB GRAPHICS

Macromedia Studio MX

PRICE: \$1,999

SUPPLIER: Macromedia (03) 9855 3100

ISSUE: Recommended, November 2002, page 71

Studio MX not only offers great value for money, it's also easy-to-use and comes with a vast array of features. It's a design-focused Web-authoring suite that offers unparalleled functionality across the board and a welcome focus on open standards.

WIRELESS CARD

Booya BWSC23

PRICE: \$265

SUPPLIER: Booya (02) 9402 9888

ISSUE: Labs Winner, April 2003, page 67

If you're looking for a wireless network card for your notebook, you need something with reliable performance and good compatibility – and the Booya BWSC23 delivers.

SOFTWARE
FIREWALL

ZoneAlarm Pro 3.5

PRICE: \$83 (US\$49.95)

SUPPLIER: ZoneLabs www.zonelabs.com

ISSUE: Excellence, May 2003, page 58

The ultimate professional software firewall to protect your PC from all those would-be hackers. It's stable, scalable, easy-to-use and offers a truly amazing feature list for the price. Honestly, you can't go wrong.

**I need a notebook with a
two hour repair service warranty.**

For most businesses, down time is costly. That's why we provide a unique 2 hour Commitment Warranty Express Service** on all Acer notebooks - such as the TravelMate 284XC powered by the Mobile Intel® Pentium® 4 Processor - M. Simply take your notebook to any Acer repair centre in Australia or New Zealand** and we guarantee to have you up and running again in 2 hours or less. Acer is the only PC vendor to offer this service.

**I like to configure my
own solutions.**

It's easy to build your own computer with Acer. Simply go to www.acer.com.au, click on ShopAcer, and select the Acer product closest to your requirements. Then, choose from a range of options using the drop down menus to build the ideal customised solution for you. An on-line glossary explains each upgrade in plain English, so you can't go wrong. When you're finished, you can buy online, over the phone or save your configuration and take it to your nearest authorised dealer.

**My company needs
back-up 24 x 7.**

If you purchase an Acer server such as the Altos G300 powered by the Intel® Pentium® 4 Processor, it is backed by Acer's 24 x 7 service hotline. So, in the unlikely event that you do encounter a problem, you can call anytime and one of our experienced technicians will help work through the problem with you on the spot.

Empowering People

REVIEWS

Darren Ellis brings you this month's selection of the latest hardware, software and reference titles.

MOBO-LISE!

Probably more insider information than you ever wanted to know.

I get to see and do a lot of things at *PC Authority*, but oddly one of my favourite parts of putting the Reviews section together is when everything is completed in a Labs; the reviews are done, the analysis complete, and the intro written. Then comes the bit I enjoy the most – when the *PCA* team thinks up a witty, yet relevant title for the Labs that almost always includes some form of pun.

In the past I've used such wonders as 'Children of the

horrors as 'Board members', 'The board and the beautiful', 'Mother horde', and some dire variations of the cliché 'mother of invention'.

Once 'Crazy-arsed mobos!' was shouted across the office in jest (I'm not saying by whom) and we'd strayed to the shorthand 'mobo' for motherboard, the awful puns began to flow with frightening regularity.

'Crazy-arsed mobos!' (never a serious contender, honest!) turned into variations of Austin

motherboards and suits the illustration fine, but I'd love to hear any title suggestions you might have for this Labs or any other Labs we might engage in.

Email some good (?) ones to me at dellis@pcauthority.com.au and not only will I award a prize for the best, but if we use your suggestion we'll list you as a contributor in the magazine for that feature!

Moving on from the minutiae of life at *PC Authority*, this

'We'd already used "Mother load" for our previous motherboard round-up, so we were left with "mother", "board" or "mainboard" as starting points. This netted us such horrors as "Board members", "The board and the beautiful", "Mother horde", and some absolutely dire variations of the cliché "mother of invention".'

resolution', for a CRT round-up (groan), 'Hertz so good', for a CPU round-up (stop it!), and once tried to slip 'You auteur be congratulated' through for a DV camera Labs (enough!). Thankfully, this latter insult to the punning arts was caught well before it made it to print.

I have to say I'm rather proud of Dan Chiappini's 'The Thick and the Dead' for May's TFT Labs, but this month's motherboard Labs (page 62) proved to be a tough naming assignment.

We'd already used 'Mother load' for our previous motherboard round-up, so we were left with 'mother', 'board' or 'mainboard' as starting points. This netted us such

Powers talking about how to get your 'mobo' back (thanks, Simon), to Morrison's 'Mr Mobo rising', and the wonderfully retro sounding 'Mobotron' and of course 'Mobophonic'.

Unfortunately someone took the homophone of mobo and ran with it, and soon suggestions ranging from the ridiculous ('Mobophobic'), to the sublimely ridiculous ('Mobosexual', 'Mobophilia' and 'Mobophilic') were arriving in the inbox.

Something had to give, before 'Mobosapiens' was accepted. We've stayed with 'Construction Zone' for the feature, which is more in keeping with the building block nature of

month has seen some excellent gear come through the Labs. We're really pleased with the first Aussie test of the Hi-Grade Xperian PC (page 36).

A few months ago in my Reviews intro (April 2003, page 34), I was talking about the fabulous PC designs available in Japan – the kind of stuff that I didn't think would ever grace our shores.

The Xperian is almost there though – it's a hybrid of Japanese chic with a touch of functional European styling. This is more a TV, radio and DVD player than a PC, and it's sure to do well wherever it's sold.

How in-depth is the subject matter? Is the product interesting and informative?

DESIGN

Is the product easy to access? Can you find whatever you need quickly?

OVERALL

A weighted and balanced collation of all the scores to give a final evaluation for the product.

A product with no equal at the time. Either a technology showcase or unrivalled quality for its time.

If you're buying, then any product with this stamp should most definitely be on your shortlist.

HI-GRADE XPERIAN

ⓘ Conceptually sound and very practical – the Xperian is much more than just a powerful PC.

ENTERTAINMENT PC

PRICE: \$3,500 – \$3,950 EST

SUPPLIER: Hi-Grade

1800 770 550

INTERNET:

www.higrade.com.au

SPECIFICATIONS: 2.53GHz Pentium 4; 512MB DDR RAM; 40-120GB hard disk; 64MB Mobility RADEON 9000; 17-inch TFT; DVD-RW or CD-RW; 56K modem; 10/100 Ethernet; two FireWire ports; Four USB 2.0 ports; PC card slot; SD/MMC reader; FM tuner; TV tuner; TV-in and S-Video out; wireless mouse and keyboard; wireless remote and stereo speakers

VERDICT: Converging digital technology, the Hi-Grade Xperian combines the traditional with new and the powerful – TV/VCR and radio, bundled in with a DVD home theatre system alongside a versatile and powerful mid-range Pentium 4 PC. This is something to look out for – or simply to look at.

The Hi-Grade Xperian can simply be described as a bundle of essential technology ingeniously put together in one desirable package.

It takes a moment for all the specs to sink in. The Hi-Grade Xperian is a powerful personal computer capable of operating as a standalone radio, television, DVD and CD/MP3 player – without having to access any of these features through the computer's OS. It represents the evolutionary convergence of digital entertainment technology: creating a single media centre.

The test model that arrived in our Labs featured a 2.53GHz Pentium 4 with 512MB DDR RAM, 40GB hard disk, a Mobility RADEON 9000 graphics card and a DVD/CD-RW drive. These core specifications alone describe a formidable mid-range PC. It has FireWire, USB, Ethernet and a built-in modem, as well as support for a variety of card media, including SD/MMC and PCMCIA. A built-in FM and TV tuner plays an important part in what makes the Xperian special, and all this is mounted behind a 17in tilt-capable LCD screen. The power adapter is built-in, and as the Xperian uses a wireless mouse and keyboard, the only cables you'll ever need go to the power and antenna sockets in the wall.

Taking a step back away from the specifications, the Xperian will never look intrusive – in fact, looking more like a flat-panel television, it will serve as a high technology fashion accessory for any room in the home. Measuring 20cm long and around 48cm wide, its slim form won't steal any valuable space; the wireless keyboard can be folded up against the screen. The DVD/CD-RW unit is located on the right near the video connectors, and pops out vertically. Side and back panels have USB, FireWire, networking, modem, optical-out ports, and PC card and card media readers. The range of high-speed connectivity options means that the Xperian can function as a hub for

peripherals like camcorders and digi-cams. Furthermore, it's able to handle wired LAN and inter-networking, and with a wireless PC card, it is able to wireless network using 802.11/Wi-Fi technology. None of these ports or plugs distract from its lounge room looks.

The LCD screen is covered by a piece of plastic that not only protects the screen from grubby fingers or spills, but also distinguishes the unit from traditional TFT designs.

A look at the wireless keyboard reveals some embedded central controls, including the unit's power/standby switch. The other buttons control the FM, TV/VCR, DVD/VCD, CD/MP3 and PC.

The true versatility of the Xperian is revealed only when you fire it up – it automatically boots into 'PC-mode', or Windows XP; however, this boot may be interrupted to switch the machine to any one of the other modes. In other words, the Xperian can be transformed into a radio, DVD/VCD player, a television, a CD/MP3 player or a PC at the touch of a button within 10-15 seconds without having to wait for the boot-up to finish. All audio/visual functions may also be accessed via the supplied wireless remote control.

Though the test model we received was shipped with only a 40GB hard disk and a DVD/CD-RW combo drive, the on-sale models will offer larger capacity drives and DVD-RWs. This means the Xperian will also be able to record and write copyright-permitting media from the TV/VCR, radio and DVDs.

The Xperian looks very polished for a pioneer model converging digital entertainment into one device. It can handle simple day-to-day tasks such as Web browsing, office productivity and reading email, as well as heavier tasks such as gaming, and recording to DVD. It's slim and

futuristic design helps its ambient roles as a television or radio playing in the background. You can shake the house by using it as a full theatre system.

But there are things to watch out for. It's easy to carry and portable, but it's not mobile. In other words it is heavy. We found that the handle on top of our test model was not sturdy enough to hold the weight of the unit alone.

You also have to keep an ample supply of AA batteries handy – the mouse, keyboard and remote are the only ways of really controlling or interacting with the Xperian.

Also, the Xperian is not built for upgrade enthusiasts – there is no serious provision for you to pop the hood and insert chunky components at will.

The many benefits of the Xperian outweigh these concerns. There is proof that a lot of thought has gone into the design and development of this machine. The Xperian represents an amazing package of both traditional and new technology – as practical as it is; we feel that it will carry the 'wow' factor for quite some time yet.

Hi-Grade plans on opening the sales for the Xperian with two models – one staring at around \$3,950, with CD or DVD-RW and 120GB, which is due very soon – around mid-June; and a the other a \$3,500 model due to be released a month after.

This unit will also have DVD/CD-RW and an 80GB hard disk. Also scheduled for release are models with 19in and 20in TFT screens.

Nirmal Chandrasena

ATHLON XP 3200+

SOCKET A CPU

PRICE: \$950 EST

SUPPLIER: AMD

INTERNET: www.amd.com

SPECIFICATIONS: Socket A; 2.2GHz; 0.13-micron process; 512KB L2 cache; 400MHz FSB; 1.65V power consumption; and QuantiSpeed architecture

VERDICT: A great processor but with features not widely supported at the moment.

PERFORMANCE: 1 2 3 4 5

FEATURES: 1 2 3 4 5

VALUE: 1 2 3 4

OVERALL: 1 2 3 4

The Athlon XP 3200+ will probably be the last Barton-core desktop processor to come from AMD before the launch later this year of the Athlon 64, its desktop 64-bit processor.

There's not a great deal of difference with this chip compared to the last crop of Athlon XPs, as the clock-speed increase from 2.17GHz (Athlon XP 2700+, 2800+, 3000+) to 2.2GHz with the 3200+ is small and makes for negligible performance gains.

The most important differentiator is the 3200+'s 400MHz frontside bus (FSB). This theoretically ups the performance matrix from the

previous chip's 333MHz FSB, but at the moment there's not a great deal of a boost.

Support at the time of writing for the 400MHz FSB was sketchy to say the least, so early adopters beware. Motherboards based on SiS's 748 and NVIDIA's nForce2 400 chipsets should be available by the time you read this, but from our early testing they weren't always stable.

We managed to squeeze some impressive benchmarks out of the processor. We tested the chip on the only board from our Labs test that could run it happily; the Gigabyte 7NNXP.

This board supports dual-channel DDR400, so you can pack

⬆️ A 400MHz frontside bus should give the Althon XP some performance headroom.

a lot of RAM around your chip. We also bundled the board with an ATI RADEON 9800 PRO, and the 3DMark2001SE Pro scores they returned were phenomenal. It was no slouch in 2D either, with a SYSmark score of 249.

If you're looking for a chip and must have the latest then go right ahead and buy, but for our money we'd hold off until 400MHz FSB support stabilises.

Darren Ellis

PIONEER DREAM PC P2400

MINI PC

PRICE: \$1,999

SUPPLIER: Pioneer

(02) 9690 2888

INTERNET:

www.pioneercomputers.com.au

SPECIFICATIONS: Pentium 4 2.4GHz; 256MB DDR-RAM; Intel 845GV chipset; 40GB 2.5in notebook hard disk; DVD-ROM/CD-RW; Intel Extreme Graphics; 10/100 Ethernet; three FireWire ports and four USB 2.0 ports

VERDICT: Stylish, quiet, and rugged, the Dream PC is a good choice for the lounge room, and qualifies as a low-end portable gaming machine for LAN nights.

PERFORMANCE: 1 2 3 4 5

FEATURES: 1 2 3 4 5

VALUE: 1 2 3 4

OVERALL: 1 2 3 4

When we opened the box for the Dream PC from Pioneer, we thought there must have been some kind of mistake. Coming in a form factor reminiscent of external hard disk units, the Dream PC packs an entire P4 system in a surprisingly small space, and at 3kg, it weighs less than some notebooks.

The Dream PC is powered by an Intel Pentium 4 2.4GHz, and has 256MB DDR-RAM, so the spec is decent. Storage is handled by a quiet 40GB notebook hard drive and a DVD-ROM/CD-RW drive. Video and audio are onboard and the Dream PC offers a good deal of connectivity with three FireWire ports, four USB ports, a serial port and 10/100 Ethernet port distributed over the front and back for easy access. The whole

compact unit feels solid, and the only real requirement for safe operation is that the fan-grill remains clear.

When fired up, the Dream PC was quiet, with the only sounds coming from using the DVD-ROM/CD-RW drive. While performance was generally smooth, it lacks a powerful video chip. It also doesn't offer surround sound, nor can it compete with a similar desktop supporting a discreet video card. It's smaller than most mini-PCs, and this makes it a handy for travelling 2D gamers.

The abundance of ports means that it can be used in a home-office environment, and the

⬆️ The Dream PC manages to be sweet-looking without crippling its performance.

Dream PC can happily be used with camcorders, digital cameras etc.

It does however, lack an internal modem, and upgrade capacity is low. We also found the power and reset buttons tedious to use. None of the surfaces had rubbery attachments, and on a smooth surface the PC presented no real resistance to sliding.

What the Dream PC lacks in raw power it makes up for with portability and looks. It offers a range of options for connecting peripherals and has the technology to handle productivity, basic games and multimedia. The Dream PC comes with Microsoft Windows XP, and different configurations are available to order.

Nirmal Chandrasena

INTEL® CENTRINO™ MOBILE TECHNOLOGY: Intel® Pentium® M Processor 1.60GHz; Intel® PRO/Wireless Network Connection 802.11b; Intel® 855M Chipset Family/60GB HDD/DVD multi-drive/512MB RAM/15" UXGA TFT screen/ATI Mobility™ Radeon™ 9000 graphics controller/SD Media slot/5.3 hours battery life (may vary depending on configuration, applications, power management settings and features utilised)/7.8 hours with second SelectBay battery /2.8kg. Intel, the Intel Inside logo and Centrino are trademarks or registered trademarks of Intel Corporation or its subsidiaries in the United States and other countries.

The wireless Tecra S1. Because you rarely have time to stop and recharge.

OBSERVATION: A wireless notebook can do wonders for your personal productivity. Especially when you spend half your day in meetings. But that's academic if your battery can't go the distance.

OBJECTIVE: Build a powerful desktop-replacement notebook based on the new Intel® Centrino™ mobile technology. Design it specifically for corporate users and the way they work.

RESULT: The Tecra S1 has all the features you could want in a desktop replacement (15" screen, DVD read/write etc). It also has integrated wireless LAN, so you can access the corporate network or the internet from anywhere within range of a Wi-Fi hub or public hotspot. Finally, the Tecra S1 is equipped with a battery that has 50% more capacity than normal. It delivers a solid five hours of life. And that means you can stay connected and productive through long meetings without worrying about your notebook turning into an expensive paperweight. That's not just good for productivity, it's good for your confidence too.

ACTION: See your nearest Toshiba Authorised Reseller, visit www.isd.toshiba.com.au or you can call 13 30 70 for more information.

Toshiba PCs use genuine Microsoft® Windows®

VERDICT: Decked out with plenty of features, this eye-pleasing model is as functional as it is stunning.

PERFORMANCE: 1 2 3 4 5

FEATURES: 1 2 3 4 5 6

VALUE: 1 2 3 4 5

OVERALL: 1 2 3 4 5

Brimming with features, the Tecra S1 is the embodiment of 'thorough'.

This is no ordinary notebook, sporting Intel's 1.6GHz Centrino processor with a 1MB on-die L2 cache, 400MHz frontside bus and a half gig of DDR. It's nothing short of impressively fast.

Intel's contradictory push that MHz isn't the be-all-and-end-all performance rule of thumb is surprisingly true here. Even at 1.6GHz, it performed amiably, returning an overall score of 179 in Sysmark2002 and just over 5,500 in 3DMark2001.

The unit's performance is inspiring, with a superb design and feature-set. The included combo

DVD-RAM/DVD-R/-RW CD-RW drive is perfect for backing up critical business data or amateur home movies.

Toshiba has included an ATI Mobility 9000 32MB graphics card. More than just a basic display adaptor, it's perfect for a machine with so much flexibility – while the easiness on the eyes makes for an ideal companion for the non-serious gamer or office user.

Rounding off the package is a meaty list of connectivity options including: SD slot; two PCMCIA bays; NTSC/PAL output; infrared; three easy-to-access USB ports and an 802.11b wireless adaptor, required for the Centrino label.

Video playback is a pleasure,

with full duplex sound support enhancing the viewing experience. Weighing in at a hair over three kilograms without power supply, it's not the lightest notebook, but given the functionality it's not bad.

It's a little steep in the pricing department, and it won't be for everybody, but power users after portability and business autonomy will be impressed.

Known the world over for its reputation and commitment to style and functionality, Toshiba's image is only further reinforced by a product of this calibre.

DELL LATITUDE D800

NOTEBOOK

PRICE: \$5,684

SUPPLIER: Dell 1300 303 275

INTERNET: www.dell.com.au

SPECIFICATIONS: 1.6GHz Intel Pentium-M; 512MB DDR; 40GB hard disk; NVIDIA GeForce4 4200; VGA and S-Video out; CD-RW/DVD; Gigabit Ethernet; 56K modem; 802.11b/g wireless; Bluetooth; USB 2.0; FireWire; mic and headphone jack

VERDICT: With excellent battery life and dual-band wireless capability, the Dell Latitude D800 is a versatile portable accessory, but its weight and large screen suit it better as a desktop replacement.

PERFORMANCE: 1 2 3 4 5

FEATURES: 1 2 3 4 5 6

VALUE: 1 2 3 4 5

OVERALL: 1 2 3 4 5

Powered by a 1.6GHz mobile Pentium processor, featuring dual-band 802.11a/g wireless capability and sporting a 15.4in wide-screen display, the Dell Latitude D800 represents the best of the Latitude series of notebooks. At around 3.3kg, it is not light, nor is it thin – but is complemented by an exceptional finish and a solid set of technology.

The performance of the D800 is supported by 512MB DDR with 40GB space. Despite graphics power not being the driving factor in most office productivity tasks, the D800 comes with a GeForce 4200 card with S-Video out. This means it

can handle some gaming – but this isn't the real highlight.

The D800 has a 15.4in wide-screen display. The display looks flawless at 1,920 x 1,200 and the widescreen is intended for business users who appreciate a larger workspace. Alongside the DVD/CD-RW combo drive, the widescreen offers a better cinematic experience for movie buffs. Though there are audio jacks, the unit does not have speakers.

With connectivity options rivalling a full desktop, the D800 has FireWire, USB, Gigabit Ethernet, and an internal modem. For those of you who don't want to be wired to

everything, the D800 comes with 802.11b/g dual-band wireless technology and Bluetooth, cutting the cables for short and long distance communication.

The included dual-band wireless technology can come in useful when on the move and the 3.5 hours of battery life is well above average. It's a little on the heavy side, and along with its widescreen, the D800 is also ideal as a desktop replacement. Note that the D800 cannot be called a Centrino as it does not have the required branding on its components.

PIONEER D400S

NOTEBOOK

PRICE: \$2,799

SUPPLIER: Pioneer Computers
(02) 9690 2888

INTERNET:

www.pioneercomputers.com.au
SPECIFICATIONS: Pentium 4
2.53GHz; 512MB DDR RAM; SiS
M650 chipset; 40GB hard disk;
DVD-ROM/CD-RW combo drive;
15-inch XGA TFT; integrated
10/100 Ethernet; 56K modem;
Windows XP Home; and a
three-year labour warranty

VERDICT: Great for power
users after speed and
portability, the D400S sports
plenty of connectivity and is
perfect for users on the go.

PERFORMANCE . 1 2 3 4 5
FEATURES 1 2 3 4 5
VALUE 1 2 3 4 5
OVERALL 1 2 3 4 5

Built from sturdy ABS plastic, Pioneer's solid-bodied D400S notebook tips the scales at 4.1kg with AC adaptor. Given its intended use, this should present no problem.

The D400S packs the usual gear, and offers well-thought out front-mounted FireWire along with 802.11b on/off controls for the optional WLAN device. We were surprised the right-hand side of the chassis contained absolutely no connectivity options – a shame given the inclusion of only a single PCMCIA port. Three USB ports are present – two rear-mounted and one on the left-hand side.

The keyboard is comfortable and has generous spacing, so there's

no cramping here. Inclusion of a DVD-ROM/CD-RW 'quiet' combo drive made for almost noise-free usage and format flexibility, a pleasant surprise given the price tag.

Pioneer's addition of a desktop P4 isn't uncommon in the budget notebook range; although it does affect battery life, with MobileMark2002 reporting just 135 minutes of usage time.

The 2.53GHz desktop processor pushed SYSmark2002, returning an overall result of 201 marks – reasonable for a notebook of this calibre. Unfortunately the SiS M650 video chip is rather lacking, returning only 1,259 marks in 3DMark2001SE Pro. This just

reinforces the fact that this is a productivity machine.

All in all, the D400S is a great unit for users after a workhorse. The notebook can take the day-to-day bumps and scratches, and comes with a three-year labour warranty. Although the battery life is a little on the lean side, the list of features and low price tag wins big points. Bang for buck, this is a great notebook for the frequently desk-bound office or student user, packing quite a punch in the feature department, but not too hard on the hip pocket.

CANON MV650i DIGITAL VIDEO CAMERA

DV CAMERA

PRICE: \$1,699

SUPPLIER: Canon Australia

1800 021 167

INTERNET:

www.canon.com.au

SPECIFICATIONS: Mini DV/PAL; 1/6-inch interlaced CCD; 800,000 pixel CCD; 8MB memory card; 1,024 x 768 resolution still images on card; 22x optical zoom; 440x digital zoom

VERDICT: Excellent consumer digital video camera with plenty of features and a very nice lens.

QUALITY 1 2 3 4 5

FEATURES 1 2 3 4 5 6

VALUE 1 2 3 4

OVERALL 1 2 3 4 5

Canon's new 600i series of digital video cameras doesn't offer any major changes to the 500i series, just a continuing improvement in quality and a few nice extras.

The cameras still look the same and are just as easy to use, but the new top of the range 650i is about as good as you are going to get in its price range.

No camera is worth a pinch of salt without a decent lens and the 2.8-61.6mm f/1.6-3.6 22x optical zoom that features across the 600i range is a beauty. The optical zoom remains sharp even at high magnification and in only average light. However, you can forget about the 440x digital zoom – its only there as a gimmick and hardly worth the trouble.

The 650i comes with Super Night Mode for recording video to tape in dark areas, and Low Light Plus for stills and video to memory card. However, you don't need to switch either on

until it gets really dark. Normal room lighting, and even candle light, will usually suffice in standard shooting modes.

Any hand movement is ironed out with the electronic image stabiliser, which works well even when shooting from a train or other moving vehicles. Dull overcast days don't phase the 650i or lessen the capabilities of either the optical zoom or image stabiliser, and it handles bright glare and reflection reasonably well.

The built-in microphone is at the front of the camera, which can present problems if shooting into a head wind, but otherwise does a good job. The wind noise can always be edited out using the editing software that comes with the camera, which is version 2 of Canon's own VideoPresenter.

Still mode (to SD or MMC card) generates photos good enough to produce postcard size

⬆ The MV650i comes in at the top of the mid-range of consumer digital video cameras.

prints and Canon has included direct print capability so the 650i can be linked directly to a photo printer and the images printed from the card. It can also be used to record brief video clips in 320 x 240 or 160 x 120 mode.

Overall it's a nice package at the upper end of the consumer range, but has the features and quality to justify its positioning and price.

David Hellaby

VIEWSONIC AIRPANEL V110

WIRELESS DISPLAY

PRICE: \$2,299

SUPPLIER: Harvey Norman

INTERNET:

www.harveynorman.com.au

SPECIFICATIONS: 10in passive matrix touch-screen TFT; 400MHz Intel XScale processor; 32MB ROM and 64MB RAM. Supports an 800 x 600 resolution

VERDICT: An excellent example of where the technological landscape is headed, but it misses out on some key features.

QUALITY 1 2 3 4 5

FEATURES 1 2 3 4 5 6

VALUE 1 2 3 4

OVERALL 1 2 3 4 5

The Viewsonic airPanel V110 is the first of its kind – a wireless, portable display that unfetters you from your PC and allows you to work around the home and office while your PC sits in another room. It runs Windows CE for Smart Panels which is like a pared-down version of Windows XP, and mimics your system desktop allowing you to access files and programs without needing to be next to your PC.

This portable 10in TFT comes bundled with an 802.11b access point to not only wirelessly connect your airPanel to your PC, but it can also be used to connect other devices. The bundle includes a full copy of Windows XP Professional so you can install or upgrade to the airPanel's required standard.

With its Tablet PC styling and functionality it's hard not

to compare and contrast the airPanel with a tablet, but we should point out that the V110 is a totally different beast and not a Tablet PC at all. It does share a touch-screen interface, it is wireless, has its own processor and RAM, but the V110 is designed as an adjunct to your current system, not as a standalone machine.

As a first of its kind, the airPanel V110 has to be applauded and we give a hearty nod to Viewsonic for releasing this, but there are a few problems with the airPanel that mean it's not as good as it may seem on paper. For starters, while the thought of wirelessly working via a portable display is appealing, in reality it's limited by data bandwidth and its 800 x 600 resolution, so don't expect to be streaming DVDs or games from your PC.

⬆ Looks very much like a Tablet PC, but it's all display.

In this regard, it's like a constantly-synced PDA.

The most inhibiting factor with the airPanel V110 is the price. \$2,299 is a lot to pay for a display with such low resolution, and even when you account for the wireless hub, WinXP Pro. While the functionality and features of the airPanel V110 that make it a compelling product, it's just not being offered for an equally compelling price.

HP PHOTOSMART 1200

The tiny Hewlett Packard PhotoSmart 1200 is a sleek, portable, flatbed scanner tailor-made for scanning small items with minimal hassle.

Weighing in at a tiny 680g with a scan bed of only 10 x 15cm it's perfect for scanning photos. Features include 1,200 x 1,200dpi optical resolution, a USB 2.0 port, CompactFlash card and shared MMC/SD slots. Power is by the USB 2.0 port, or by four AA batteries when unplugged.

This scanner can capture an image of 300dpi in 14 seconds and at 1,200dpi in 90 seconds. Images may be directly transferred to storage card media. If a printer is handy, the PhotoSmart 1200 can be used to duplicate photos without a computer.

The scanner lid is removable, which helps you capture partial images of objects larger than the scan bed. You can then use the bundled ArcSoft Panorama software to assemble these partial-

captures into a complete image.

The build quality of the PhotoSmart 1200 is excellent. The only part that was found to be a little flimsy was the rubber USB port cover. The MMC/SD and CF card slots are protected by a solid piece of plastic that completely detaches, a problem if you were to forget about it. The unit features a simple onboard LCD display that indicates battery power, selected image quality and remaining space making the device feel similar to a digital camera.

The software is user friendly and operating the scanner is straightforward. Scanning photo-sized documents posed no problems, but scanning larger documents on the small scan bed was tedious.

The HP PhotoSmart 1200 ships

Ⓢ A small scanner with some big capabilities, the PhotoSmart 1200 is now part of the go-mobile wave.

with a USB cable, setup poster/guide, user manual, and a CD with HP photo and imaging software, HP Instant Share, HP Memories Disc Creator and Arcsoft Panorama Maker. Memory cards and batteries are not included, and the scanner is not capable of recharging the batteries.

Featuring independence from wired power, light weight, small size and the ability to write directly to card media, the HP PhotoSmart 1200 saves on time, space and the bulkier hassles associated with larger scanners.

OVERALL 1 2 3 4 5

DELTRON CINEMA DISK

The DELTRON Cinema Disk is a portable media player capable of handling audio and video files while doubling as a 20GB portable external hard drive. It offers USB 2.0 connectivity, and reads CompactFlash (I & II) and Microdrive flash cards. The player supports MPEG-1 and MPEG-2 formats, MP3, and JPEG files and it has outputs for stereo audio, S-Video and composite. The chunky Lithium-Ion battery makes the Cinema Disk much less portable while it's attached, however, the device may also be powered directly through an AC adaptor.

The build quality of the Cinema Disk is excellent: the controls are intuitive and accessing the data using the backlit display is fairly simple. It ships with an IR remote, which can be used to activate an OSD on the display from a distance. The remote is small, rugged and not easy on the fingers. No matter how you

decide to control the unit, the Cinema Disk is almost completely silent when in operation.

The unit's S-Video and composite outputs allow you to connect the unit to a television, or using the supplied cable, an S-Video capable monitor. The device can act like a CF card reader when connected to the computer via USB. Its functionality and portability mean that flash cards from a digital camera for example, may be emptied into the Cinema Disk. If images are encoded as JPEGs, the Cinema Disk can output them to a TV while an MP3 is playing in the background. Interestingly, the unit has no support for recording and doesn't include a line-in or microphone.

The complete package includes

Ⓢ The 'wow' factor is still fresh with this versatile media player.

a slim carry case, remote control, Li-Ion battery, USB cable, S-Video and composite cables, car charger, AC adaptor and a manual. Also, for those bandwidth hungry media freaks, a FireWire version of the player is due to be released.

Overall, the DELTRON Cinema Disk is a decent unit for playing audio and video on your TV or PC, however, as it's slightly on the chunky side when its battery is attached, its portability is limited.

MYOB BUSINESS BASICS

ACCOUNTING

PRICE: \$199

SUPPLIER: MYOB

(02) 9770 9000

INTERNET:

www.myob.com.au

REQUIREMENTS: Pentium 200MHz; Windows 98 or later; Windows NT 4.0 with service pack 6.0; 200MB disk space; Internet Explorer or Netscape Navigator 4.0 or higher

VERDICT: What small operators and sole traders have been crying out for – a low cost version of MYOB that sticks to the basics.

EASE OF USE ... 1 2 3 4
FEATURES 1 2 3 4
VALUE 1 2 3 4 5 6
OVERALL 1 2 3 4 5

When Quicken decided to revamp its range and take on MYOB's Premier products with its new look QuickBooks Pro, MYOB countered by stepping into Quickens traditional turf at the lower end of the price range.

MYOB's new Business Basics is aimed squarely at Quicken Cashbook and QuickBooks and is going to give them quite a shake up. It might also backfire on MYOB in some sectors of its market as small operators find benefit in 'downgrading' to the cheaper product.

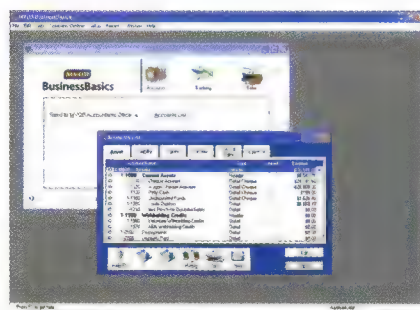

It takes about 30 minutes to set up and anybody who has used any of the MYOB range before will find it a breeze to use.

However, I've never been a great fan of MYOB's interface and newcomers might find it a bit difficult to find their way around at first. It is not as intuitive as some of its competitors, but once users come to grips with the 'MYOB

culture' they will find it is not as complex as it looks. The program will do everything a small trader wants – keep track of incomings and outgoings, create invoices and quotes, and provide a range of essential reports. Unlike QuickBooks, which has lost the old remittance advice from the bottom of its invoices, Business Basics does the opposite.

It provides a remittance advice with multiple payment options including Bpay, credit card by phone payment, and cash or EFTPOS using POSTbillpay and the standard 'put the cheque in the mail'.

Like QuickBooks, Business Basics allows you to email invoices and quotes direct to customers as PDF attachments; and send reports and data to your accountant.

⤴ Anyone who has used MYOB will quickly come to grips with Business Basics.

If you have kept your books in order during the month or quarter, your business activity statement will automatically be reconciled at tax time so all you will have to do is copy the figures over on to the official form.

Overall it provides enough for small operators, and at \$199 it is a better buy than other accounting products with features you'll never use, but are for four or five times the price.

David Hellaby

QUICKBOOKS PRO

ACCOUNTING

PRICE: Upgrade \$685; full copy \$1,495

SUPPLIER: Reckon

(02) 9577 5000

INTERNET:

www.quicken.com.au

REQUIREMENTS: 250MHz Pentium (350MHz recommended); 64MB RAM; 250MB hard disk space; Internet Explorer 6.0; and Windows 98/ME/NT4.0 (SP7a)/2000/XP

VERDICT: Restructuring of the QuickBooks range means this is now going head-to-head with MYOB Premier and is a worthy rival.

EASE OF USE ... 1 2 3 4
FEATURES 1 2 3 4 5
VALUE 1 2 3
OVERALL 1 2 3

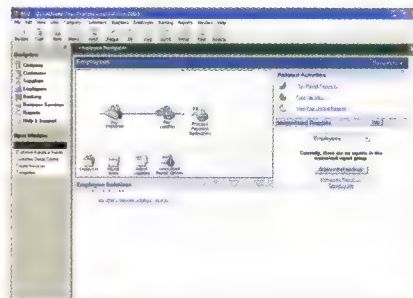

The slump in the accounting software market since the introduction of GST has seen the major players completely revamp their products. For example, QuickBooks Pro once sold for less than half its current price and was designed for small business. Today it is aimed at medium-sized enterprises and comes with five licences and an integrated full payroll function. Small businesses are now offered a choice of QuickBooks or QuickBooks Plus but have lost some of the features they once had, such as job costing.

There have been several changes made to QuickBooks this year apart from the integration of the payroll. Transaction auditing has been improved; you can now create assembly items; report templates can be customised and reconciliation reporting has been enhanced. Journals are now automatically numbered and are

easier to reverse, and you can create multiple estimates for a single job.

There is one other unfathomable change. For some unknown reason Quicken has dropped the Remittance Advice option from the bottom of its invoice templates and if you upgrade to the current version you will suddenly find it missing.

But it is the payroll feature and five licences that Quicken is relying on to sell the product. The idea is that if you set up the payroll during the Easy Step interview, you will be able to run payroll from navigator or menu options within QuickBooks allowing simultaneous updating of your accounts with the payroll data. The payroll allows for tracking of leave, superannuation, deductions and allowances, the printing of pay slips, cheques and ATO payment

⤴ The new integrated payroll can be tricky to set up and difficult to come to grips with.

advice. However, if you have not set up a payroll before, this can be quite a tough job and even experienced users have found the new QuickBooks payroll a bit tricky, which is a pity because most of the rest of the program is fairly intuitive.

Overall, it stands up well against MYOB Premier, which offers three licences instead of five, but has a multi currency option that's not found in QuickBooks Pro.

VERDICT: A locally produced and relatively new entrant in the market – and one well worth a look.

EASE OF USE ... 1 2 3 4 5

FEATURES 1 2 3 4

VALUE 1 2 3 4

OVERALL 1 2 3 4

Accounting software is a tough market to get into and is littered with the carcasses of many who had tried and failed to take on the established giants in Quicken and MYOB. Business Breeze is a locally designed product specifically aimed at the small business market.

It has been developed with a typically Aussie no-nonsense attitude – forget fancy features, just make it easy to use – and that's why it should succeed.

It has a simple and straight forward menu. If you want to make a cashbook entry click on Cash Book; if you want to write and invoice, click on invoicing; if you want to pay staff, then click on payroll. It's all in one menu.

In keeping with the simplicity theme, the user manual can be lifted without having to bend your knees. It's 34 pages, but still shows you the fundamentals.

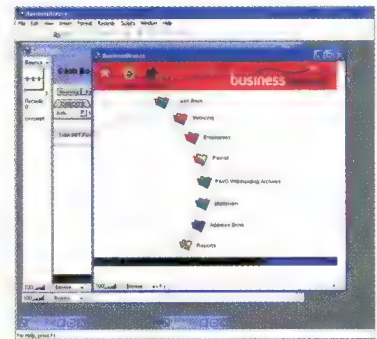

As long as you have a basic

understanding of bookkeeping you should be able to master Business Breeze in under an hour and that means no added expense and lost time associated with having to go through a training course to learn the program.

When you do a job or sell a product, you write an invoice. When it's paid, you enter the payment. When you pay a bill you enter the amount and as long as you put in the correct tax codes, Business Breeze does the rest.

The payroll module is a breeze compared to QuickBooks Pro and MYOB. Once you have created an employee on your books just fill in their time sheets, rate of pay, tax rate etc, and it will calculate overtime and superannuation deductions.

Business Breeze allows you to create your own stationery, just as long as you don't want to get

Ⓢ The Business Breeze menu is simple but very functional and easier to navigate than its competitors.

too fancy.

While it does not have the nice looking interface of QuickBooks, it is easy to navigate and does the basics well.

At \$329, which includes the payroll module, it compares favourably with MYOB's new Business Basics. The only problem is that at this stage it does not have the loyalty base of MYOB and may struggle.

INTRODUCING NEW RANGE OF PRODUCT

USB/Ethernet Combo ADSL Modem

- Connect single or multiple PC's via USB or Ethernet
- 10BaseT LAN interface - USB 1.1 interface
- Supports G.dmt and G.lite
- Built-in PPPoE and PPPoA Clients
- Ethernet Bridge Mode
- Configuration & Management via Web Browser
- Telstra Approved

22Mbps Wireless ADSL Modem/Router/Switch/Access Point

- Connects single or multiple PC's on an Ethernet or Wireless LAN to ADSL
- Built-in 22Mbps Access Point, Router, 10/100Mbps 4 Port Switch, ADSL Modem
- Supports IP Routing, NAT, DHCP
- Configuration & Management via Web Browser, Telnet
- Telstra Approved

i2eye™ Broadband Video Phone

- Standalone Video Conference Operation (No PC Required)
- 10/100Mbps Fast Ethernet Port for LAN or Broadband Connection
- Video & Audio Out for Television Connection
- Streaming Video at up to 30 Frames/Second
- Adjustable Tilt & Focus Lens
- Built-in Microphone

22Mbps Wireless IP Router for DSL/Cable Modems with 4-Port 10/100Mbps Switch

- 22Mbps Wireless LAN Access Point
- Compatible with IEEE 802.11b (DSSS) 2.4GHz Standard
- 64/128/256 Bit Wired Equivalent Privacy (WEP) Security Support
- 10Mbps WAN Port for DSL/Cable Modem
- Support NAT for single IP Address & Firewall Protection
- Supports DHCP, VPN, PPP, PAP/CHAP Security
- Advanced Firewall Features
- Configuration & Management via Web Browser

22Mbps Wireless IP Router for DSL/Cable Modems with Switch and Print Server

- 22Mbps Wireless LAN Access Point
- Compatible with IEEE 802.11b 2.4GHz Standards
- Built-in 4 Port 10/100Mbps Switch, Single Parallel Printer Port
- Supports NAT, DHCP, PPP, VPN, PAP/CHAP Security
- DMZ selectable Port
- Advanced Firewall Features
- Configuration & Management via Web Browser

IP Router for DSL/Cable Modems with 4-Port Switch & Single Port Print Server

- 10Mbps Ethernet Port for DSL or Cable Modem connection
- 4-Port 10/100Mbps Switch
- Auto-Negotiation of MDI-II/MDI-X Cross Over for Easy Expansion
- Signal Parallel Port Print Server
- Support NAT for single IP address & Firewall Protection
- Supports DHCP, VPN, PPP, PAP/CHAP Security
- Built-in Telstra BigPond client

Ethernet ADSL Modem

- Connect single or multiple PC's on an Ethernet LAN to an ADSL service
- 10BaseT Interface (RJ45)
- ADSL Interface (RJ11)
- Support G.dmt and G.lite
- PPPoE (RFC 2516) & PPPoA (RFC 2364)
- Ethernet Bridge Mode (RFC 1483)
- Built-in PPPoE Client
- Configuration and Management via Web Browser
- Telstra Approved

VPN Router for DSL/Cable Modems with 4-Port Switch

- 10Mbps Ethernet Port for DSL or Cable Modem connection
- 4-Port 10/100Mbps Switch
- RS232 Serial Port for backup Analog Modem
- Internal DMZ (Demilitarised Zone)
- LAN-to-LAN VPN Connection (8 Tunnels Supported)
- Stateful Packet inspection (SPI)
- NAT for single IP Address

IP Router for DSL/Cable Modems with 7-Port Switch & Single Port Print Server

- 10Mbps Ethernet Port for DSL or Cable Modem connection
- 7-Port 10/100Mbps Switch
- Auto-Negotiation of MDI-II/MDI-X Cross Over for Easy Expansion
- Signal Parallel Port Print Server
- Support NAT for single IP address & Firewall Protection
- Supports DHCP, VPN, PPP, PAP/CHAP Security
- Admin via Windows based program, Telnet or Web Browser
- Built-in Telstra BigPond client

Ethernet ADSL Modem

- Connect single or multiple PC's on an Ethernet LAN to an ADSL service
- 10BaseT Interface (RJ45), ADSL Interface (RJ11)
- Support G.dmt and G.lite
- PPPoE (RFC 2516) & PPPoA (RFC 2364)
- Ethernet Bridge Mode (RFC 1483)
- Built-in PPPoE Client
- Configuration and Management via Web Browser
- Telstra Approved

Network Secure Firewall with Point-to-Point VPN

- True Firewall suitable for Home or Small Office LAN
- 2 x 10/100Mbps Fast Ethernet Ports for: External LAN Connection (i.e. ADSL or Cable Modem), Internal Connection
- Internal DMZ (Demilitarised Zone)
- LAN to LAN VPN - Stateful Packet Inspection - NAT/DHCP

LEADERS IN WIRELESS AND BROADBAND COMMUNICATIONS

MACROMEDIA FREEHAND MX

➤ The new streamlined interface and Object panel put you firmly in control of your work.

FreeHand has had a long, distinguished career since its launch 15 years ago, but time has caught up with it. While

Macromedia concentrated development on its Web-oriented MX applications, FreeHand was put on the back burner and fell seriously behind its main rivals CorelDRAW (see *issue 60*, p54) and Adobe Illustrator (see *issue 51*, p88). So, is this latest release evidence of further decline, or has FreeHand finally risen to the challenge?

One of the surest signs of FreeHand's age – and Macromedia's lack of interest – was the program's antiquated and unhelpful interface. But the working environment has now been given the full MX treatment, with the previously free-floating palettes conveniently docked and arranged into collapsible panel groups. There are still occasional idiosyncrasies, such as the dedicated Halftones panel, but the new shared Spell Checker and Answers panel reinforces the cross-application MX identity, boosting efficiency.

The biggest boost comes from the new Object panel. This incorporates the features of the former Object, Fill, Stroke and Text Inspectors into one central panel for controlling everything about your design elements' appearance. The way FreeHand MX manages its formatting has also been radically overhauled. In particular, objects now support multiple attributes, allowing you to add more than one stroke and fill to your

object. Each attribute is listed at the top of the Object panel, and each can be quickly formatted.

The range of formatting power has also been enhanced. For its fills, FreeHand MX includes support for the latest Pantone libraries, as well as two new gradient types: Cone and Rectangle. Gradient handling has also been greatly improved, with four new behaviours: Normal, Repeat, Reflect and Auto Size. These determine how the gradient fills its object, and the introduction of Fill Handles lets you interactively change the direction and centre of your gradient. FreeHand MX also offers smoother brush paths and a new Calligraphic option, which produces naturalistic line effects by using any object shape as a customisable nib.

FreeHand's Object panel not only allows you to add and control fills and strokes, but can also apply an entirely new kind of formatting attribute to your design elements – Live Effects. These change the object's appearance, or just its fill or stroke, but non-destructively. So you can always alter parameters to fine-tune the effect or remove it entirely. The flexibility and creativity this opens up is extraordinary, especially as FreeHand offers vector and bitmap-based effects.

Special effects

Of the six vector options, the Bend, Ragged and Sketch effects all distort and randomise lines to give a less clinical feel to your artwork, while the Expand Path command lets you widen strokes and add fill-based formatting. The Duet effect is particularly striking, enabling the creation of arrangements based on clones of the current object. Transform is the most workaday effect, but also the most useful as it allows you to apply scaling, skewing, rotation and positioning effects as an object attribute.

The raster effects are even more welcome, however, as they enable bitmap-based formatting

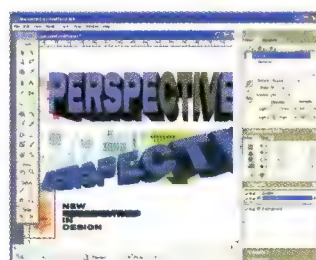

within FreeHand's vector-based environment. The Blur and Sharpen effects are self-explanatory, while the Bevel, Emboss, Shadow and Glow filters will be familiar to Fireworks users. The Transparency effect is the most powerful of all, as it expands FreeHand's existing lens-based approach by enabling feathered and gradient transparencies.

Put FreeHand's new support for multiple fills, strokes and effects together and it's possible to create some amazingly rich formatting very quickly. Plus, once you've created an appearance you like, simply drag it onto the Styles palette ready to apply to any other object. You can also quickly redefine existing styles by editing an instance and then dragging it back onto the palette – all objects that share the style are automatically updated.

FreeHand's new approach to formatting is undoubtedly powerful, but it's worth pointing out that the real credit for this belongs to Adobe, which pioneered the system in Illustrator. Of the two implementations, Illustrator remains the more creatively powerful with its support for features such as blend modes and Photoshop filters, but the FreeHand system is simpler to manage. Regardless of which company deserves the credit, there's no question that it takes FreeHand's creative power to a new level.

New tools

And that's before we look at FreeHand MX's revamped toolset. It's unrecognisable at first, as nearly all the old tools have been replaced by new offerings. This is largely due to a much-needed rationalisation, which sees linked tools (such as the various transformation tools) grouped in flyouts; former tool variants (such as the Pen tool's Variable Line and Calligraphic variations) promoted to standalone tools; and many of

➤ The Extrude tool offers the most striking new effect.

VECTOR DRAWING

PRICE: \$795; upgrade \$297

SUPPLIER: Macromedia

INTERNET:

www.macromedia.com.au

REQUIREMENTS: Pentium II 233MHz; 64MB of RAM; 70MB hard disk; Windows 98/ME/NT/2000/XP

VERDICT: With its streamlined interface, seriously enhanced formatting, expanded toolset and improved integration, FreeHand is back with a bang.

EASE OF USE... 1 2 3 4 5 6

FEATURES... 1 2 3 4 5 6

VALUE... 1 2 3 4 5 6

OVERALL... 1 2 3 4 5 6

the previously semi-detached Xtras (such as the Roughen, Smudge, Shadow and 3D Rotation tools) incorporated into the toolbox.

Other changes to the toolset are less obvious but more fundamental. FreeHand's core drawing capability has been improved with a new rubberbanding feature for the Pen tool, letting you preview the next line segment. There's also a new Snap to Object feature to work alongside Snap to Grid. FreeHand MX's core shapes – rectangles, circles and polygons –

offers a quick and interactive way of setting up blends – simple but very effective. The Extrude tool applies 3D depth to an object by simply dragging to specify a distance and direction. Once the main effect is set up, you can double click on the object and rotate it in 3D space while using the Object panel. A variation I haven't seen before is the ability to apply path-based profiles to the extrusion, which enables 3D lathing effects and the creation of realistic objects such as vases.

The Extrude tool is

surprisingly powerful and, with the ability to share vanishing points, makes an excellent partner to FreeHand's existing Perspective tool for producing pseudo-3D artwork. It's certainly the highlight of FreeHand's improved new

Combinations of fills, strokes and effects can be saved as reusable styles.

have also been given Live-Edit intelligence, so you can quickly turn them into rounded rectangles, arcs and stars.

There are also plenty of new tools. The Eraser works like a rubber to delete the portion of the vector path it passes over. The Connector Lines tool lets you drag-and-drop connecting lines between objects that automatically adapt as you move the objects – useful for flow diagrams. There's also a new Output Area tool that lets you set an area of a page for outputting to print or exporting. You can also mark up a series of pages in the same way – a reminder that, unlike Illustrator, FreeHand supports multiple pages.

FreeHand MX also features two new effects-based tools. The point-and-click Blend tool

toolset, but again a sense of déjà vu is unavoidable. This time it's CorelDRAW that largely deserves the credit, as nearly all the new tools and handling seem to be straight lifts. Again, FreeHand users won't be worried about that – they'll just want to get stuck in.

Bitmap handling

FreeHand's major weakness has always been its bitmap handling, and this version still lacks the ability to apply colour corrections or filters to bitmaps. You can forget Deneba Canvas-style pixel-based editing, but it does now support alpha-channel transparency for imported TIFF, PSD, PNG and GIF files. This might not sound important, but it's essential for producing layouts that seamlessly combine bitmaps and vectors.

Rather than offering its own internal bitmap power, FreeHand relies on the user having access to an external editor. Ideally, of course, you'll be using Studio MX Plus with Fireworks MX. Bitmap images in any format can now be opened in Fireworks with a single click in the Object panel and then automatically updated. The support for Fireworks' PNG format is particularly strong; I was amazed when I imported a test file and the text, objects and their raster-based styles all remained editable. The round tripping is just as advanced in reverse, as Fireworks MX can directly open and edit FreeHand MX files too.

Most users, however, will be most interested in the integration with Flash MX. This was already strong in version 10, with features such as a Flash-style, antialiased preview option, support for symbols, built-in previewing and advanced SWF export. These capabilities have been improved across the board: the antialiased display is now the default; you can replace objects with symbols just as you can in Flash; the Test Movie window now offers built-in navigation controls and one-click exporting; and the SWF Export settings have been rationalised, although the ability to save to earlier versions is gone.

New additions make the integration tighter still. The new Action tool allows you to drag from any object to any page,

automatically creating Go To links – ideal for producing presentations. For more advanced power, you need to turn to FreeHand's Navigation palette. This has been revamped

and offers greater ActionScript power – including Load and Unload Movie support – to add more advanced interactivity to your designs.

Of course, FreeHand can never hope to compete with Flash on this front, so the most important new feature is the ability to import SWF files into your FreeHand layouts. Embedded SWFs appear as snapshots in your page, preview correctly during testing and are re-exported as movie clips when you publish your movie. Even better, with a single click in the Object panel you can open the SWF's associated FLA file directly into Flash with all edits automatically updated. Not surprisingly, FreeHand MX files can also be in the same manner.

FreeHand still doesn't lead the pack for innovation or creativity, but this latest release recovers all the lost ground.

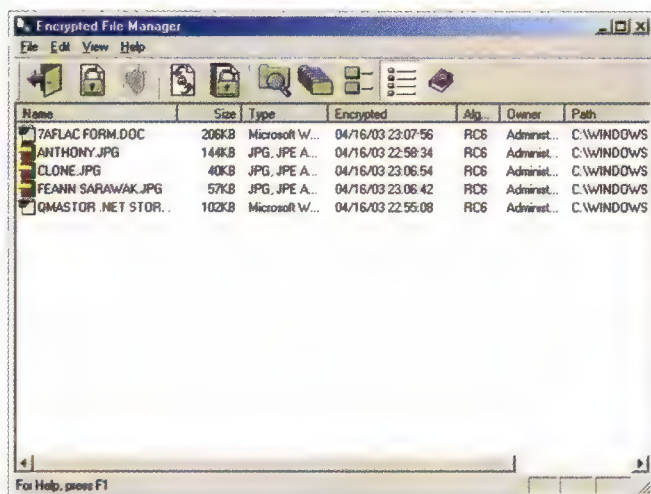

If you want to produce design-intensive work for both print and the Web, FreeHand MX is now your best option – most obviously via the new Studio MX Plus bundle, which includes Flash, Fireworks, Dreamweaver and a copy of Contribute as well. By combining the streamlined MX interface with Illustrator's visually rich formatting and styling, and CorelDRAW's extensive toolset and effects, this upgrade is a revelation.

Tom Arah

Non-destructive vector and raster effects radically boost FreeHand's formatting power.

HARDKEY/EG PRO

➤ The Encryption Manager gives details of encrypted files and folders.

➤ This USB key is exceptionally small and easy to lose – beware!

ENCRYPTION DEVICE

PRICE: \$199.95

SUPPLIER:

Success Storm

INTERNET:

www.successstorm.com.au

REQUIREMENTS: Pentium or higher; USB port; 10MB hard disk space; Windows 98/ME/XP/2000

VERDICT: Well made, easy to use and a highly robust Net/desktop encryption solution. Flexible and simple, it might worth the price if the manual was half decent.

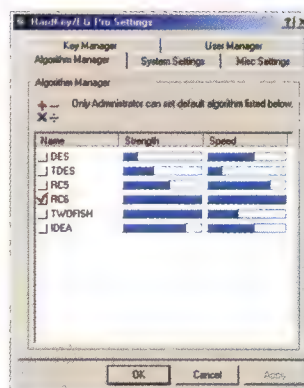

QUALITY 123 1000
FEATURES 123456
VALUE 12 1000
OVERALL 123 1000

The HardKey/EG Pro is a combination of USB dongle and software together encrypting files or systems keeping your data safe from prying eyes.

When you open the package, you'll notice straight away that you don't get much for your money. Two hundred bucks for a CD, a tiny plug-in USB dongle and a very slim manual. But as with many digital devices, small is usually beautiful.

It does however do a very effective job of protecting your data from those who might want to access it – including yourself if you lose the dongle. Encryption is 128-bit, so you can kiss your data goodbye if the USB HardKey vanishes into the ether. Luckily it comes with a hole for a cord so you can hang it round your neck and keep it close by.

The USB key is equipped with a tiny green LED to show it is working when inserted. Once recognised by the OS and the drivers located, it can be hot-

➤ Various types of encryption standards are available.

plugged in and out as often as required – even while using encrypted files.

Installation is a fairly straightforward process. Slot in the CD, load the key control software and have a browse through the CD-based manual if you feel like it. However, most users should get to the 'reboot your PC now' stage without needing assistance. The program then launches the Key Generation Wizard which does a good job of taking you through the generation of up to 20 logical keys for different users, and for online users' public keys for file access over the Net.

During this process the passwords and their associated key IDs can be stored on removable media – the program suggests a floppy disk – so you can invoke a rescue file in case of memory lapses. While this is useful, the included Basic User Guide is not, and can only be described as a dog. If it was any less effective, it would bark. About the same size as a sheet of toilet paper (coincidence?), it looks like a badly-trimmed, laser-printed fortune cookie.

Half the bottom line was missing and the print quality was shocking. To include it with such a decent product is ridiculous. Luckily, the CD-based manual is noticeably better, with decent screenshots and step-by-step instructions.

In use – that's with the HardKey dongle plugged in – the

system behaves normally; but if a file is accessed via Explorer, two extra menu items pop up on right clicking. These offer either immediate encryption, or Net encryption for sending to a public access key holder. If the file is encrypted, it can only be accessed when the HardKey is plugged in. Although it appears as a standard file, any attempts to open it throw up a 'No access' or 'File in use' error message if no dongle is present. Plug the dongle in, and the file is instantly accessible. Even unplugging the HardKey with an encrypted file open under its application does not faze the digital smarts – it simply reverts to encrypted once closed.

However, not so impressive is the fact that if an encrypted file is moved to another drive it becomes open access.

Likewise, if an encrypted file is opened and changed, the encryption is lost. In both cases the file needs secondary encryption – a bit tedious.

This applies even though the file is still listed as encrypted in the HardKey file manger applet. Admittedly the files cannot be opened or moved without the HardKey in the first place, but this aspect is a nuisance easily leading to accidental decryption of files.

The effect of this is diminished by using an encrypted folder. All files saved or moved to this folder are encrypted by default.

The software allows a selection of encryption algorithms: DES, TDES, RC5, RC6, TWOFISH, and IDEA are all selectable. Right clicking on any file displays its properties and encryption details.

One neat extra is the screensaver. Right click on the System Tray icon, and set the screensaver to 'on'. As soon as you remove the HardKey the computer screen is blanked and the keyboard locked.

Extremely effective; just plug the HardKey back in and everything is immediately accessible again.

Overall, a solid, simple and effective security device.

Jeremy Torr

“ I never realised the simple act of plugging my PC into a power point would expose it to damaging problems ”

- Lee Johnson, Home PC User

“ The spikes and surges coming in through the power socket were actually causing screen freezes, lock-ups, and other annoying problems. ”

Lee Johnson, Home PC User

Do you experience similar PC problems? Keyboard lock-ups and frozen monitors are usually caused by bad power, which can threaten your PC up to four times a day.¹ In addition, surges, sags and blackouts are nine times more likely to strike your PC than a virus² and are not just generated from lightning strikes. Something as simple as switching on a heavy appliance inside your home can jeopardise both your hardware and data. In fact, power disturbances are the largest single cause of data loss, accounting for 45.3% of problems.³

Why APC?

APC has a complete range of surge protectors and uninterruptible power supplies (UPS), protecting more computers than any other power protection brand. In fact, Lee Johnson is just one of APC's 12 million satisfied customers. Our solutions are also compatible with your existing equipment due to our partnerships with other leading IT companies, such as Cisco, IBM, Sun, Dell, Microsoft and more.

APC Desktop Power Protection: the best value protection, ideal for home and small/medium business.

Telephone, fax, modem and DSL line surge protection protects your PC while online.

Up to 22 minutes* of battery back up time will keep your PC running during brief blackouts.

USB and serial connectivity ensures compatibility with all equipment.

FREE auto shutdown software saves files in the event of an extended blackout.

Multiple battery and surge outlets provide protection for all your equipment.

2-year warranty includes battery, spare parts and labour for added peace of mind.

APC has won more awards for reliability and innovation than all other UPS vendors combined.

Our Guarantee to You

If your properly connected equipment is ever damaged by a power anomaly APC will replace the product and reimburse the fair market value of the connected equipment up to \$200,000. Visit www.apc.com.au for policy terms and conditions.

"The APC Back-UPS[®] CS keeps my business up and running regardless of the situation behind the plug in the wall. It integrates smoothly with Windows XP, leaving me free to focus on my business, rather than on the technology."

ASUS

P4C800

DUAL CHANNEL MOTHERBOARD **DDR400, 800MHz FSB**

Presenting the new ASUS P4C800 Deluxe running on the Intel 875P "Canterwood" chipset and Pentium 4 processor on 800MHz FSB. Combined with Dual-Channel DDR 400 and Deluxe Features.

Key features include Intel Performance Acceleration Technology (PAT) boosting performance 5~10%, multi-RAID function allowing RAID 0 and RAID 1 array to co-exist. The ASUS Intelligence features of automatic detection and monitoring of critical functions through AI Net, AI Audio, AI BIOS and AI Overclocking.

Proudly distributed by Achieva Technology, the ASUS P4C800 Deluxe simply outperforms and outsmarts all competition.

FEATURES:

- For Intel S478 Pentium 4/ Celeron up to 3.06 GHz+
- Intel Hyper-Threading Technology ready
- 800/533/400MHz FSB
- PC3200/PC2700 ECC/non-ECC DDR memory
- Dual-Channel DDR architecture up to 4Gb Max
- ASUS Intelligence Features
- IEEE 1394 x 2 ports
- 3COM Gig Lan supporting 10/100/1000 BASE-T Ethernet
- Virtual Cable Tester Net-Diagnosing Utility
- Intel ICH5R 2 SATA ports & 2 channel ATA100 IDE
- Promise 20378 ATA133/SATA RAID controller
- AGP Pro/8X, 8 x USB 2.0 ports.

CA ETRUST ANTIVIRUS V7

Computer Associates (CA) is one of the biggest names in the software industry, even compared to Microsoft. Most of its business is done in the enterprise and corporate field, and this heritage shows in eTrust Antivirus.

Although the program sells for a consumer-friendly \$59, it is loaded with high-level capability and options for the network administrator. The software pack comes with versions for Pocket PC, Mac, NetWare, Solaris, Linux, Lotus Notes, and Exchange Server as standard. Plus, if that isn't enough you can download a Palm version from the Website.

Originally developed by Aussie firm VET, eTrust offers two separate scan engines for antivirus and inoculation, plus the usual Web-based updates for new signatures. CA says this avoids the increasingly common situation where smart viruses cripple or infiltrate the AV engine. In addition, the program allows for

remote installation and management of virus scanning, making it ideal for large networks. eTrust also incorporates some high-strength user conformance utilities that help stop the most common virus entry point – the irresponsible user at the desktop. These options offer enforcement of policy restrictions over floppy access and Web usage as well as configuration of scan and updates (which incidentally are sent at the same time as they are added into the CA database, not just on a daily basis).

The initial scan performed on our test machine took a swift six minutes, and identified existing infected files with no problem. Scanning the PC is initiated from a simple Explorer-like interface, which allows selection of scan routines down to individual file level if required. A right click 'Scan directory' option is also available

➤ The Explorer-like interface scan-accesses everything including removable drives.

from the standard Windows Explorer window, and a realtime monitor in the System Tray checks all incoming and outgoing Net traffic for potential threats. In use eTrust was fast and recognised all connected devices.

Overall, eTrust is a thorough and highly configurable AV option suitable for standalone and power/network users.

CREO SIX DEGREES 1.51

The only problem with email is that it's difficult to sort through them or track down any important attachments.

Creo believes it has the solution in Six Degrees which can track down attachments and emails quickly by building relationships.

Six Degrees constructs a database of links between email addresses, messages and attachments during installation. It's a slow process, but this is the only time that Six Degrees leaves you waiting. It will take a couple of minutes of hard disk chugging before it's finished, but afterwards Six Degrees actively synchronises the database and takes virtually no time to call up the links. In fact, it's unbelievably quick – everything comes up almost instantly. You can say goodbye to re-sorting your emails by sender and wading through to find the attachment you're after.

The interface is as basic as it gets: three buttons at the top show attachments, messages or people,

along with a search bar. So, if you want to find a lost attachment from a specific person, just type the name in the search bar, right click on the contact result that appears, click Make Focus, and all the attachments and emails come up in the appropriate fields.

This is easy enough, but you can't help feeling that this could have been sped up. Why not automate the whole process so it displays all the attachments and emails instantly without having to click Make Focus?

This is certainly sensible if you have thousands of emails about a particular subject, or several people with the same name sending you emails. But it would still be better to have complete automation as an option, particularly as you can limit the results by refining them to cover only the last week, month, six months or year.

Another annoyance is that it only works with the 2000 and XP versions of Outlook and Windows.

➤ Six Degrees finds lost email attachments in no time, wherever they've been stored.

Also, if Outlook automatically moves messages to other folders (including Deleted Items), Six Degrees loses track of them.

But these complaints are only minor, and Six Degrees is otherwise a very impressive and useful tool. The potential for boosting productivity is enormous, and not having to trawl through your emails and sit through Outlook's painful search process is nothing short of a godsend.

Whether you're upgrading your existing PC or building one from scratch, the motherboard you choose is of pivotal importance.

Make the wrong decision and you could be left behind when the next generation of hard disks, graphics cards and memory hits the market.

For many, the first decision is whether to use an Intel or AMD CPU. Then there's the chipset. This determines support for memory types, AGP 8x graphics cards, USB 2.0 and much more. As well as giving a guide to each chipset's features, we have tested their speed in both 2D and 3D (*see Performance analysis, page 66*).

But there are plenty more decisions to be made beyond the processor and chipset. Factors such as expansion potential, integrated components, memory type and even overclocking options must be weighed up, as they all differ from board to board.

While purists may still consider integration to be a dirty word, we were surprised at the high quality of integrated components. The majority of motherboards have six-channel audio – adequate for all but the most demanding users – and 10/100 Ethernet. In addition, several feature built-in Ultra ATA RAID, Serial ATA and even Gigabit Ethernet.

The layout of this Labs differs from others we've conducted recently. Instead of presenting winners, and then smaller reviews, we've grouped boards by chipset, with descriptions of the advantages and disadvantages of each. From within these groupings, we've chosen the best AMD and the best Intel boards overall.

To find out exactly what features each board has, take a close look at the Feature table on page 64 – you won't find a more detailed side-by-side comparison, so if you're looking to

perform an upgrade, or build your own PC, this Labs holds all the answers. Plus, with prices ranging from \$119 to \$1,088, we've got every budget covered.

PERFORMANCE ANALYSIS

The Labs team delves into the guts of this month's motherboards, and points out what you need to know to choose the right one for your needs.

The main component of a motherboard that determines the features it supports and its performance is the chipset. Boards with the same chipset may differ in terms of layout, BIOS features and accessories provided, but their performance is typically within a couple of percent of each other (which is virtually negligible in real world terms). For this reason we decided to group the boards by chipset in the reviews to make things easier to digest. As such, instead of presenting results for every motherboard in this Labs, we've given the results by chipset.

We benchmarked boards with SYSmark2002 and 3DMark2001SE Pro to give an indication of day-to-day computing strengths, plus 3D crunching abilities. Although some motherboards came with onboard graphics, we chose to benchmark with GeForce FX 5200 graphics cards with NVIDIA Detonator FX drivers (rev. 44.03).

Each machine had a fresh install of Windows XP Professional (with XP SP1 installed), the BIOS flashed to the latest revision, and the latest drivers installed. Each board was benchmarked with 256MB of Corsair DDR400 and when applicable this was dropped to 256MB of DDR333.

Intel boards were benchmarked with a 3.06GHz Pentium 4, and AMD boards with an Athlon XP 2700+ (2.166GHz). We did have a 3200+ (2.2GHz) in the test Labs, but at the time of testing support for the chip was sketchy, and it didn't run on many of the motherboards we tried, so we chose a processor that would be accepted across all the motherboards. We also tested with Hyper-Threading disabled in the Pentium 4 as some motherboards objected to this too. The lesson is to double check the manufacturer's Website as well as user forums for compatibility advice before you purchase. Most manufacturers will update the BIOS to support new products very soon after release.

Performance

Interestingly, the SiS655 chipset proved to be a strong contender, with high scores in both SYSmark2002 and 3DMark2001SE Pro, which is due to its dual-channel memory controller, AGP 8x and 1GHz Northbridge-Southbridge link.

The other SiS chipset, the 648, has been around for a while and is the oldest on review here, but it receives a performance boost from its enhanced memory controller that saw it take on the Intel and

VIA chipsets.

An extremely interesting turn-out was the low-ish results for the Intel 875 and 875P chipsets. Although this chipset supports dual-channel memory architecture, and an 800MHz FSB, it was slow in 3DMark2001 SE Pro (with the 875P far outshining the 875 but behind the majority). In day-to-day tasks, 875 proved to be a decent powerhouse.

Intel's 'Granite Bay' e7205 chipset also has dual-channel memory controllers, but in this case it worked well returning high scores particularly in 3DMark2001 SE Pro.

The new Intel 865/865PE Springdale chipset turned out to be the one to watch. Although this chipset did not have the fastest or highest scores, it did return scores that were consistently high. It also allows for a lot of goodies, such as plenty of USB ports, SATA, 800MHz FSB and more. The inclusion of integrated graphics on some models is nice, but don't expect blazing results if you use this option.

The same goes for the NVIDIA nForce2 boards. Their onboard graphics performance is pedestrian, but even without this the chipset scored very low in all performance tests compared to the VIA KT400.

CHIPSETS: SYSMARK2002 OVERALL

CHIPSETS: 3DMARK2001SE PRO

Boards

The chipset is only a building block for a motherboard, and although it determines what can and cannot be supported, it's up to the manufacturers to build their boards with the options they deem valuable.

The features score (right) for each motherboard is a conglomeration of points awarded for various features and functions. This included points for integrated audio, video and networking, upgradeability (such as PCI slots), RAM support and RAM slots available, frontside bus speeds, USB, FireWire, Ultra ATA speed, RAID, SATA ports included, AGP speed, and much more. All in all we awarded points for over 20 specifications. The chart to the right is a representation of the total feature points awarded to the motherboards.

In the reviews we've rated the motherboards on their quality (including warranty, layout, build quality etc), feature-set, value, which is derived from the quality and features scores with price factored in, and given an overall rating. As performance differences between boards with the same chipset is nominal (a few percent at most), we haven't included a Performance star rating (as all boards in the same chipset would have received the same score). Instead we have opted for a Quality star rating that reflects important factors such as the build quality and the layout of the board.

Regarding the terminology in this Labs, and all the different names out there for DDR-RAM, we've chosen to stick with the MHz rating for clarity's sake, and we're abandoning the bandwidth rating. This means 333MHz DDR RAM will be referred to as DDR333 instead of PC2700; and 400MHz DDR RAM as DDR400, not PC3200. This also means we're not necessarily acknowledging the ratification issues surrounding memory standards. Always check with your motherboard manufacturer's site for RAM compliance before making a DDR RAM purchase.

Our thanks go to Achieva Technology (www.achieve.com.au) for lending us the testbench components.

MOTHERBOARD: FEATURE SCORES

THE REVIEWS

We've sorted the reviews by chipset, with the AMD boards first, then the Intel, so you can easily find the motherboard to suit your needs.

VIA KT400/KT400A

VIA has dominated in the AMD arena in the last couple of years, and its latest offering is the KT400 chipset. Despite the name, it officially supports up to just DDR333 memory, but many boards offer limited DDR400 support. AGP 8x is supported, as are 200, 266 and 333MHz FSBs. That's all thanks to the new VT8377 north bridge.

The V8235 south bridge is the same as used in VIA's P4X400 chipset for the Pentium 4. It has six-channel audio and USB 2 but no FireWire. All in all, the KT400 pales against the nForce2 for features though.

Introduction of a 533MB/sec V-Link interconnect to the Southbridge doubles the bandwidth compared to the KT333, resulting in nice quick transfers onto the Southbridge, and things like the hard disks and PCI cards.

VIA's KT400A Apollo chipset boasts DDR400 support, a 20% increase in memory

bandwidth to the CPU compared to DDR333. The revised KT400 also introduced native SATA support for up to four devices, as well as up to four parallel ATA devices.

VIA's FastStream64 technology also uses an extended array of prefetch buffers to reduce latency in the memory controller, improving performance at lower transistor cost than dual channel offerings.

Athlon

Duron

ABIT KD7-SL

PRICE: \$185

SUPPLIER: Altech (02) 9735 5655

INTERNET: www.altech.com.au

Finishing around the middle of the features and benchmark department this month, the KD7-SL still has a lot going for it. DDR400 support and SATA RAID make it a very attractive board in the sub \$200 price bracket. It offers generous spacing, eliminating the need of having to remove cards to get at RAM slots. With its very reasonable price tag it's an ideal candidate for consumers on a budget after plenty of bang for their buck.

GIGABYTE 7VXP Ultra

PRICE: \$329

SUPPLIER: Synnex 1300 880 038

INTERNET: www.synnex.com.au

Compared with some other VIA KT400A boards, the Gigabyte 7VXP Ultra is a little pricey, although it's also the most feature-packed. It's the only KT400A board to include two IDE controllers with RAID, as well as on-board FireWire. It also offers six-channel audio and Gigabyte's Dual BIOS, which backs up your BIOS in the case of emergency. Build quality is excellent and it comes with a three year warranty.

MSI KT4A Ultra-FISR

PRICE: \$245

SUPPLIER: MSI (02) 9748 0070

INTERNET: www.msicomputer.com.au

The VIA KT400A chipset forms the foundation of the KT4A Ultra-FISR motherboard. Unlike the two other MSI boards in this roundup, the KT4A only supports SATA, and not IDE, RAID. While it outscores the Soltek SL-KT400A-L (another KT400A board), it comes with no FireWire ports. Though nothing else stands out about the KT4A Ultra, it scores well and is a well rounded board.

SHUTTLE AK39N

PRICE: \$150

SUPPLIER: SATO (03) 9899 6333

INTERNET: www.satotech.com.au

A barebones Athlon mobo, the AK39N has enough functionality to set this board apart as an ideal platform for building a home PC or workstation. It comes with 10/100 Ethernet, five PCI slots, ATA/133 support and six-channel audio, but little else. Its three DIMM slots are passable and can take 3GB of DDR400, and its relatively uncluttered layout means you'll be able to add the extras with ease.

SOLTEK SL-KT400A-L

PRICE: \$154

SUPPLIER: Altech (02) 9735 5655

INTERNET: www.altech.com.au

Another inexpensive Soltek board that's not too heavy on the feature-set, this KT400A board sports the bare minimum to scrape by, with six channel audio, dual USB 2.0 ports and ATA/133 support. On the plus side it has a whopping six PCI slots so you can upgrade or add essentials. We do wonder why the power connector is all the way over on the other side of the CPU though. At \$154 it still makes a great budget board.

OVERALL	1 2 3 4 5 6

NVIDIA nFORCE2

The nForce2 the only dual-channel memory controller available in the AMD pantheon.

There are two north bridges to choose from: one with integrated GeForce4 MX-class graphics (nForce2 GT) and one without (nForce2 ST). Both offer support for AGP 8x and up to DDR400 memory, although we recommend you use DDR266 or DDR333 memory in synchronous mode (DDR266 for chips with a 266MHz FSB, DDR333 for those with a 333MHz FSB) for best performance.

The nForce2's integrated graphics processor is designed to match GeForce4 MX performance. Where it may not be able to compete against the likes of a card like a GeForce4 Ti 4200, it can handle current 3D games at lower resolutions.

Athlon

Duron

Two south bridges are on offer for the nForce2: the MCP (Media and Communications Processor) and the MCP-T. The MCP-T is the upper-class model offering support for FireWire, dual

Ethernet and SoundStorm hardware audio support. Audio is identical to the original nForce, providing proper Dolby Digital AC-3 sound. The MCP variant, available for value motherboards, will offer support for a single network channel and standard AC'97 audio.

The HyperTransport link between the north and south bridges also remains the same as for the nForce and allows them to exchange data at up to 800MB/sec.

ABIT NF7-M

PRICE: \$274

SUPPLIER: Aus PC Market (02) 9746 0900

INTERNET: www.auspcmarket.com.au

A board with middle-of-the-road features, the NF7-M boasts a well-designed and spacious layout with some nifty additions. The dual DDR memory controllers with three DIMM sockets allow for up to 3GB of DDR333 (or 2GB of DDR400). Integrated GeForce4 MX AGP graphics and six-channel AC'97 audio makes it ideal for a basic entertainment machine, although you'll want a separate 3D card for serious gaming.

COMMITTED TO XCELLENCE This is not an illusion. Let CTX monitors take your visual experience to new heights, providing you with the ultimate in viewing pleasure. Brilliant colors pass through your corneas, dart through your pupils and retinas, and zoom into your nerve cells - exciting your optic nerve and pleasuring your brain. If you have personally experienced this visual pleasure, you will understand the effort CTX has made on your behalf. For 21 years CTX engineers have insisted on making only monitors. Time and again they have demanded refinement that goes beyond refinement, and picture quality that is not just true-to-life, but truer-than-life. CTX's manufacturing process ensures the highest levels of quality control whilst constantly striving to be environmentally friendly. CTX monitors' low radiation and electromagnetic energy emissions even passed Sweden's tough MPR-II and TCO99 safety regulation testing. In terms of technology CTX has never stood still, continually investing in R&D and endeavoring to attain design perfection. Consequently, the performance of CTX monitors has been consistently recognized in the US and Europe, receiving numerous professional awards including *PC Magazine's* "Editor's Choice" award, and "Test Winner" in Germany's *PC Games Hardware*. In addition, we have also received outstanding reviews in professional publications such as *Computer World* and *PC Advisor*. With products in 76 countries worldwide, CTX strives to give you not only superior quality monitors, but moreover provides you with a window to the world. The comprehensive CTX product line further demonstrates CTX's commitment to professionalism. The stylish CTX LCD monitor is available in 15-inch, 17-inch, and several larger sizes. Choose from wall-mount or 90-degree rotating screens. In addition, the LCD monitor's convenient vertical panel brings you high brightness, high contrast, and outstanding color picture quality - giving you all the sharpness of original colors. CTX's CRT monitors range in size from 15 to 21 inches. Among them, the PR series uses "pure flat" FD Trinitron picture tubes, guaranteeing vivid colors and picture quality that is both high-resolution and glare-free. CTX develops monitors to their greatest potential. Be it economy or professional high-level machines - all will serve you with a veritable feast of visual enjoyment. Chuntex Electronic Co., LTD. INTERNET: www.altech.com.au

Well and truly gone are the days of boring green and brown PCBs – and welcome to the yellow motherboard, care of Soltek. The SL-75FRN2 supports ATA/133, but has only two IDE connectors with no SATA or RAID support. It also has no FireWire ports, offering a modest two USB 2.0 ports. The price is very low, but this board is comparatively bare in features. It does ship with an impressive software bundle though.

SL-75MRN-L

PRICE: \$206

SUPPLIER: Altech (02) 9735 5655

INTERNET: www.altech.com.au

This is one of the few nForce boards here to take advantage of both the GeForce4 MX graphics chip, as well as supplying an AGP 8x slot. It has a well-spaced layout, but by all accounts is an average nForce board in comparison to the others. It comes with the requisite three DDR slots, five PCI slots and nForce2 MCP audio controller, with its one and only standout being its \$206 price-tag, which is a good price for what you get.

BYE BIOS!

The motherboard BIOS is about to get a serious makeover. Software developer Phoenix Technologies is about to deliver a new design that promises vastly improved functionality, while Intel is promoting what appears to be a similar technology.

Both believe the BIOS as we know it has had its day, which is good news for users, who are likely to gain new tools to aid system security and recovery.

Phoenix's Core Management Environment (cME) is a protected space that's independent of the OS and could provide users with access to a host of applications, such as Phoenix's own Web browser, antivirus software or a system recovery application. Applications sitting in the environment are called FirstWare.

The company, which claims to provide BIOS software for 75 to 80 percent of PCs worldwide, said cME would provide a user-friendly interface. *continued on p83...*

INTEL 845PE

The 845PE was supposed to be Intel's mainstream desktop DDR chipset, although the E7205 (the Granite Bay), and now the 865 and 875, have stolen much of its thunder with dual-channel DDR.

However, it remains an appealing platform thanks to Hyper-Threading support, official DDR333 support and the ICH4 south bridge, which includes the USB 2.0 controller. While there's also an enhanced AC'97 controller, most manufacturers choose to use separate six-channel audio.

One of the main limitations of the 845PE is its support for AGP 4x only. The other limitation is that the chipset supports a maximum of 2GB of memory, and only two

Pentium 4

Celeron

double-sided DDR DIMMs can be used because banks two and three are shared between two sockets.

Essentially, the 845GE is identical to the 845PE but with integrated Intel Extreme Graphics.

Addition of a CNR slot allows for cheaper implementation of peripherals such as: LAN; DSL; USB; wireless technology; audio and modems, although there aren't a great deal of available CNR peripherals floating around, so its value is pretty nominal.

In performance terms, the lack of dual-channel DDR lets the 845 down, and only its generally lower price would make us recommend it over the 865 or 875.

ASUS P4PE

PRICE: \$289

SUPPLIER: Acheiva (02) 9742 3288

INTERNET: www.achieva.com.au

The board's ability to increase CPU core voltage in 0.025V increments as well as adjustable FSB/DDR ratio with fixed AGP/PCI frequencies allows for maximum performance with absolute control. Thermally regulated cooling is used to keep the machine cool and quiet, while the bundled antivirus software helps you keep an eye on your machine's security. Overall a solid board with decent features and price.

ECS Elitegroup L4IPEA2

PRICE: \$157

SUPPLIER: Protac (02) 8748 8888

INTERNET: www.protac.com.au

At the very reasonable price of \$157, ECS's L4IPEA2 is a great little board. The attractive purple PCB features hardened rounded corners to avoid damage, while the small form factor would make it ideal for a smaller system. Lacking AGP 8x, bearing only two DDR slots and no FireWire connectivity, it's not the most feature packed-board, but it's cheap and basic, and the layout is good. Perfect for an upgrade or budget machine.

QUALITY 1 2 3 4 5

ALBATRON Intel 865PE Pro II

PRICE: \$315

SUPPLIER: AMI (02) 9763 2122

INTERNET: www.ami-computers.com

Albatron's offering to the 865P family is bursting at the seams with features. SATA and IDE RAID, eight-channel audio, FireWire, dual channel DDR, USB 2.0 and Gigabit Ethernet is all brilliant, but at the surprisingly low price of \$315, this is definitely worth consideration if you're after a board for your 800MHz Pentium 4. The 865 is also a top performer, so you know you'll get the most bang for your buck.

QUALITY	1 2 3 4 5
FEATURES	1 2 3 4 5
VALUE	1 2 3 4 5
OVERALL	1 2 3 4 5

INTEL 865/865G

Intel's 865G chipset (codenamed Springdale), is almost identical to the 875 (Canterwood), and is designed to support the new Intel Pentium 4 Processor with Hyper-Threading as well as the 800MHz front side bus (FSB). It also includes 8x AGP, USB 2.0 and Serial ATA support.

Dual channel DDR gives a performance improvement over single channel DDR, which is especially important for the Pentium 4, as it sports a faster system bus than the Athlon XP, and thus demands more memory bandwidth to get the most from the CPU. The memory performance is most noticeable in multimedia and 3D-intensive applications, which depend a great deal on the memory.

The 865G platform has been specifically tailored for use as a stable platform for corporate and consumer users, while the 865P and PE boards are geared towards

AOPEN AX4SG Max

PRICE: \$390

SUPPLIER: BluechipIT (02) 8745 8400

INTERNET: www.bluechipit.com.au

Built with convenience in mind, this board features six board-mounted USB 2.0 ports, and two more on a rear panel. Its Die-Hard II BIOS is designed to prevent damage from viruses, while Intel integrated graphics, six-channel audio, SATA and plenty of USB ports round of the package nicely. Overall, a great board for the connectively-concerned and while it's costly, for a motherboard, you get plenty of integrated peripherals.

INTEL 875/875P

The Intel 875P chipset (codenamed Canterwood) is very similar to the 865 in features. In fact, the 875P is essentially just the best silicon from the same line as the 865, which enables Intel to include its new Performance Acceleration Technology (PAT). PAT basically represents streamlined and aggressive memory settings, meaning you need to use the best quality RAM when running an 875P. With dual channel DDR400 support, this has the potential to make the 875P the top Pentium 4 performance chipset.

The 875P supports AGP 8x, although at this stage there are no options for integrated graphics, which makes sense given the positioning of this chipset.

The 875P is also designed specifically to work with the new Pentium 4 with Hyper-threading straight out of the box.

It also features Intel's CSA

(Communication Streaming Architecture), which is a dedicated bus for networking straight to the memory to improve Gigabit networking performance.

The chipset also supports USB 2.0 as well as Serial ATA with RAID. Addition of AC'97 audio provides native six-channel audio on board, better than some PCI cards available separately.

Pentium 4

Celeron

ABIT IC7

PRICE: \$308

SUPPLIER: Altech (02) 9735 5655

INTERNET: www.altech.com.au

The IC7 offers support for up to 4GB of dual channel DDR, delivering bandwidth of 4.8GB/sec. Decked out with every port known to humanity, it has integrated FireWire; USB 2.0; SATA; 10/100 Ethernet and six-channel audio. Solid build quality and a two-year warranty put this board up there with the best of them. With plenty of FSB and multiplier options, this board is definitely geared for the overclockers.

ABIT IC7-G

PRICE: \$450

SUPPLIER: Altech (02) 9735 5655

INTERNET: www.altech.com.au

Almost identical to the IC7, the IC7-G also features Gigabit LAN and four SATA connectors. Three fan headers on the board allow for the heat sink fan, case fan and an auxiliary fan, which is good for tweekers. Side mounted IDE ports stop cables draping over other peripherals, which improves cooling. You do pay a premium for the extra SATA and Gigabit Ethernet, though, so if you're not going to use it, then go for the IC7.

ASUS P4C800 Deluxe

PRICE: \$399

SUPPLIER: Acheiva (02) 9742 3288

INTERNET: www.achieva.com.au

One of the most interesting features of any board in this Labs is the 'AI' in the P4C800 Deluxe. The board will automatically inform you if you've plugged the wrong sort of peripheral into an audio jack, as well as informing of network cable problems. There are plenty of BIOS options for tweaking and overclocking too. If you're not after Gigabit LAN or want a few less SATA drives there's some stiff competition for the price though.

SiS 655

Pentium 4

Celeron

SiS wasn't far behind Intel with its own dual-channel chipset – the 655. This goes one step further than the E7205 to offer PC2700 support for a bandwidth of 5.4GB/sec, far in excess of the 533MHz FSB Pentium 4's capability, giving extra room for AGP and I/O. AGP 8x support is also part of the

specification. A proprietary interconnect, which SiS calls MuTIOL 1G, provides a bandwidth of 1GB/sec between the

north bridge and 963 south bridge. The latter features integrated controllers for six-channel audio, USB 2.0 and FireWire, bolstering the chipset's appeal.

Performance is good compared to the 845 and E7205, mainly due to the additional bandwidth and 1GB/sec MuTIOL 1G link.

GIGABYTE 8KNXP Ultra

PRICE: \$1,088

SUPPLIER: Synnex 1300 880 038

INTERNET: www.synnex.com.au

How could a motherboard possibly cost over \$1,000? The short answer is: if it has *everything* built in. The 8KNXP is geared towards the server market, and is the only board in this Labs with an Ultra360 SCSI controller. Ultra360 SCSI still delivers over twice the bandwidth of IDE or SATA. The 8KNXP also features just about every other integrated peripheral except video, making it an expensive choice, but a one stop shop.

continued from p72...

Companies in discussions with Phoenix include Compaq, which has a prototype Tablet PC with an instant-on button giving direct access to a calendar and contacts list; Fujitsu Siemens, which uses the F4 button on a PC keyboard to open up FirstWare before booting into Windows; and McAfee, which is discussing making its antivirus software a FirstWare application.

Intel's vision is along similar lines. Its Extensible Firmware Interface (EFI) promises a tiny but independent OS and, like cME, would allow system builders to place diagnostic tools inside that would still be accessible if the main OS crashed.

However, Intel's solution looks more likely to be a long-term replacement for the BIOS, while Phoenix will have products on the market this year.

MSI 655 Max-FISR

PRICE: \$250

SUPPLIER: MSI (02) 9748 0070

INTERNET: www.msicomputer.com.au

Based around the SiS655 chipset, the MSI 655 MAX-FISR is a well rounded Socket 478 motherboard. With six PCI slots, support for six USB 2.0 ports, Firewire, IDE and SATA RAID, connectivity options for this board are excellent. Board layout is unconventional, and the power connector is perilously close to the CPU socket, which could interfere with cooling. The 655 also ships with a Bluetooth connector as a bonus.

SiS648**Pentium 4****Celeron**

SiS's 648 is one of the oldest chipsets on test here, and parallels many of the features of the Intel 845. It still has AGP 8x, 533MHz FSB and DDR333 support, though. In fact, the only major feature lacking compared

with the 648 is dual-channel memory architecture.

The memory controller supports only

DDR and can offer bandwidth up to 2.7GB/sec under DDR333, which is less than the 4.2GB/sec needed by a 533MHz FSB Pentium 4. Ultimately, it's still useful as a budget Pentium 4 or Celeron chipset, but it's not a top performance option.

**ABIT****SR7-8X****PRICE:** \$165**SUPPLIER:** Altech (02) 9735 5655**INTERNET:** www.altech.com.au

One of only three ABIT boards in our roundup supporting ATA/133, the SR7-8X lacks SATA and features only two-channel audio. However, what it lacks in hardware features, it makes up for in scalability. The overclocking function includes CPU frequency; multiplier, CPU and memory voltage adjustment for maximum system performance. For another \$20, we'd recommend the KD7-SL as the better buy.

OVERALL	1 2 3 4 5

INTEL E7205

Recently Intel recognised it needed a stop-gap chipset with dual DDR before the release of the Springdale and Canterwood (865 and 875 respectively). Enter the Granite Bay, now named the E7205. It has a wider set of capabilities than the 845 chipsets, and supports dual-channel DDR memory and AGP 8x although it doesn't support an 800MHz FSB. It also offers USB2.0, ATA/100 and Dolby 5.1 integrated sound.

One reason Intel has traditionally pushed RDRAM over DDR is that dual-channel RDRAM was the only memory technology that could match the high front side bus speed of the Pentium 4. Now with dual-channel DDR, the E7205

takes full advantage of the 533MHz FSB (front side bus) used by Northwood B Pentium 4 CPUs, even when using DDR266 RAM.

The E7205 northbridge Memory Controller Hub (MCH), and the Southbridge is the 82801DB I/O Controller Hub (ICH4), which supports ATA/100 but not SATA.

It's also worth noting that it's not worth using memory faster than

DDR266, such as DDR400 and DDR333. The E7205

relies on a synchronous memory bus - using inexpensive DDR266 memory, the memory controller supplies 4.3 GB/sec of bandwidth, matching that of the Pentium 4 533 MHz CPU bus.

**ASUS****P4G8X Deluxe****PRICE:** \$375**SUPPLIER:** Acheiva (02) 9742 3288**INTERNET:** www.achieva.com.au

A little lacking in the feature department, the P4G8X Deluxe is lean in some big areas. Short 800MHz, DDR400 or DDR333 support, its biggest selling points are its BlueMagic PCI slot, inclusion of PC-cillin antivirus software, and Asus PC Probe for system monitoring. If you're after a better rounded board, and want to save some money, we'd recommend you check out the Albatron 865P Pro II.

QUALITY	1 2 3 4 5
FEATURES	1 2 3 4 5
VALUE	1 2 3 4 5

**TYAN****Trinity S2662AN****PRICE:** \$387**SUPPLIER:** Altech (02) 9735 5655**INTERNET:** www.altech.com.au

The S2662AN differs from most of the mobos in this Labs in that it's designed as a workstation class board. It features Gigabit LAN, a healthy four DIMM slots, five PCI slots and two USB 2.0 ports, but it's only concession to the consumer world is its inclusion of a six channel digital SPDIF RCA audio output. It's a costlier board, but certainly robust and worth the outlay. For consumers, go for an 865-based board.

MEDIA
TECHNOLOGIES

One card for all Video Editors

ACEDV^{io} is the world's only video card that is completely compatible with hardware of video editing applications and all widely used video equipment.

Whether it's a Windows® or Mac OS® computer, VHS or DV camera, Minolta, Final Cut Pro®, Xpress® DV or Premiere® editing software, Canopus ACEDV^{io} is the one card for all editing environments providing the broadest compatibility, longest product life and highest return on investment.

Key Benefits

- > Provides analog and DV full-resolution compatibility for leading editing and DVD authoring applications including: iMovie®, Final Cut Pro®, Xpress® DV, Premiere®, Edius®, MediaStudio® Pro and Windows Movie Maker.
 - > Compatible to all widely used analog and DV cameras and decks including: VHS, S-VHS, Hi8, Digital, DV and iVCRAM, PAL and NTSC standards supported.
 - > Compatible with Windows and Mac OS computers.
 - > Provides the industry's highest quality analog-to-DV and DV-to-analog video conversion with locked audio support.
 - > Provides video output to a monitor or television while editing.
 - > Features adjustable brightness, contrast, saturation, hue and sharpness controls on analog video input.*
 - > The broadest editing software support and video equipment compatibility ensures a longer product life and a high return on investment.
 - > Three-year warranty.
- *Windows only software.

RRP \$899

PH 144 1228 3000 2000

The ultimate Upgrade Kit

The PC Authority Labs team shows you how to give your PC a new lease on life.

Why buy an entirely new PC for a couple of thousand bucks when you can achieve the same result by spending less than half that amount? If your PC is reasonably new, then the chances are most components in it are still quite workable and it's only the performance-related parts that need a bit of a kick in the pants. In this feature we take a look at your upgrade options for PCs from different eras, and show you how to get the most for your money.

We've taken PCs that are representative of the kinds of systems that have been on sale over the last few years and made them our upgrade platforms. We have a system from 2000, one from 2001 and one from 2002, and we've turned them into a variety of new machines, with better performance and even some new functionality. As a rough rule of thumb we've aimed to spend around one third the initial purchase price of the PC on core upgrade components, which should give it at least another two or three years of life.

The reason we didn't go back to 1999 or earlier is that a PC from this era will have so many old components that will need to be replaced that you might as well buy a new PC, or build one from scratch. With a PC from the Pentium II days, upgrading can easily become a cascading process. For example, to upgrade the processor, you need a new motherboard, which means new RAM, and a new power supply, which means a new case etc. And there's not much point attaching a 4GB 5,400rpm ATA/66 drive to a Pentium 4 – so that'll need upgrading too, and so on. By the end of the process, you'll be lucky to still have a floppy drive and mouse pad left from the original system. So, if you have an older PC like this, don't fret – we'll be running a full feature on how to build your own PC from scratch in an upcoming issue.

We've run a series of benchmarks on both the original machines and their upgraded counterparts to see the difference in performance the new components make in a variety of applications. We've also built a couple of specialist boxes out of the original PCs to show you the options you have when it comes to turning your old system into something new and funky.

So grab your Philips head screwdriver, your anti-static strap, your favourite high-caffeine beverage, and let's get stuck in.

98 SE

ORIGINAL SYSTEM

This PC represents the standard fare from early 2000. It sports a Pentium III processor, coupled to a ubiquitous Intel 440BX motherboard, 128MB of PC100 SDRAM and a 32MB NVIDIA TNT2 graphics card. The most popular OS from this time was Windows 98, although by the end of 2000, new PCs were being shipped with Windows ME. There's not a heck of a lot of difference between the two OSes, although Windows ME does have a slightly slicker interface, and makes key things such as installing drivers easier than in Windows 98.

Back in 2000 a PC like this was more than capable of performing most tasks, such as browsing the Net and running office applications like Office 97 or even the new Office 2000. The 128MB of RAM would have meant Windows would make quite a bit of use of the swapfile on the hard disk, thus slowing things down a bit. The swapfile also would have been held up by the 5,400rpm hard disk, which is slow by the standards of 7,200rpm disks of today.

In today's applications, the 2000 era PC would still be passable, although the main bottleneck will be the RAM, and running things like Windows XP or Office XP would prove more frustrating than fruitful. You can see how the 2000 era PC runs today's applications from the SYSmark2002 benchmark scores on *page 88*.

The NVIDIA TNT2 was a top 3D card for the time, and will comfortably run games like Half-Life, although it pales in comparison with even entry-level 3D cards available now. If you want to play anything more intense than a real-time strategy, or just about anything with

3D from today, the TNT2 will prove woefully inadequate, as shown by the 3DMark2002 benchmarks on *page 88*.

BUSINESS UPGRADE

When it comes to configuring a PC for business usage, compared to home use, there are a couple of differences. A home PC will often be running one or two large applications, such as games or video editing, meaning the CPU is the key component for speed. However a business machine is more likely to be running multiple applications, such as email, Internet browser, word processor, spreadsheet etc – all concurrently. This means that while the CPU is important, it's RAM that is the performance bottleneck as all these applications are taking up memory. When you run out of RAM, your hard disk steps in to fill the gap, and then the crunching, and waiting, begins as the swapfile does its work.

In our upgraded business PC, we have swapped out the motherboard so we can fit in a faster Duron 1.3GHz processor, along with 256MB of DDR RAM. As RAM is so inexpensive these days, if you want more, it will only cost around \$100 to put in an additional 256MB on top of that. You can see in the benchmarks on *page 88* that the Duron with 256MB of RAM delivers over twice the performance of the original system.

The other main change with the business PC is the inclusion of Windows XP

Professional. The only reason we chose Pro over the Home edition is you need Pro if you want to connect to a network with a domain, such as in an office.

We've also changed the graphics card to a GeForce4 MX440, not for the 3D performance, but because the old AGP 2x TNT won't work in the KT400 motherboard, which accepts AGP 4x as a minimum. The MX440 should cost you under \$100 though, and it also delivers a greater range of resolutions and refresh rates to boot.

The rest of the specification has been left the same to keep the cost of the upgrade down. Still, by just upgrading these components, you can add a good couple of years to the life of your business PC.

HOME UPGRADE

The target for the home system upgrade from the original 2000-era PC was to breathe some new life into the system and make it capable of running today's applications and games for the lowest possible cost.

We've gone for the same Duron 1.3GHz and 256MB of DDR RAM as in the office PC as the Duron is unparalleled for price/performance in the budget arena. If you want to run some more serious applications, like video editing, you can

always use the same KT400 motherboard and replace the Duron with an Athlon XP for another \$100 or so.

Many home users want to play games, and the old TNT2 just can't cut the mustard these days. We've chosen to replace it with a GeForce4 Ti4200 as it delivers very impressive performance for the price and will allow you to play the latest games at reasonable quality settings and frame rates. We ran the original system and the upgraded system through 3DMark2002 to see how they compare, and as you can see, the difference is huge – a massive six times faster.

Unlike business PCs, which will usually utilise a network for storing documents and files, a home PC needs to keep everything locally. For

2000 SYSTEM PERFORMANCE ANALYSIS

SYSMARK 2002

3DMARK2001 SE

this reason we have upgraded the hard disk to a 40GB 7,200rpm drive, giving you plenty of space, and a boost in I/O performance too.

We've also upgraded the OS to Windows XP Home, as you don't need the extra features of the Professional edition, and Home edition is a bit cheaper as well.

2001 era PC

ORIGINAL SPECS

Pentium III 800MHz (Slot 1); 100MHz FSB; Intel 440BX; 128MB PC133 SDRAM; 20GB 7,200rpm ATA/100 hard disk; 8X max. DVD-ROM/CD-R/CD-RW; 32MB GeForce2; SB Live! OEM; 17in curved; Windows ME

ORIGINAL SYSTEM

In 2001, the Pentium III was reaching its peak, and while the Pentium 4 had hit the streets by this time, its performance was uninspiring and the price was high. Our 2001-era PC sports a 800MHz Pentium III on a 440BX motherboard, although by 2001 the new PGA version of the Pentium III was also starting to spread, coupled with the 815 motherboard. The CPU is backed up by 128MB of PC133 SDRAM. In 2001, 7,200rpm hard disks were becoming the norm, and the GeForce2 GTS and SoundBlaster Live! were the standards in 3D graphics and sound respectively. You could also expect a DVD-ROM drive as standard on most systems, or perhaps a fairly slow CD-R/RW – around 8x was the max back then.

The 800MHz Pentium III would be fine for most office applications, although like the 2000-era PC, the RAM would have proved to be one of the main performance bottlenecks by forcing Windows to use the swapfile. Just throwing in another 256MB or so would do it a world of good for most applications. For this reason, we've chosen some more interesting and specialised systems for the upgrade to show you the kinds of things you could turn your 2001 PC into.

HOME THEATRE UPGRADE

An increasingly popular upgrade option for many PCs is to turn it into the core of a home theatre. The Pentium III 800MHz should be ample for running DVD movies without a decoder card, although there are a couple of components you'll want to replace to get the best DVD experience.

The GeForce2 GTS was a decent card for

DVD playback through your monitor, although if you want to output the signal to your TV (or if you have the cash – a plasma screen or projector), then you'll want something like a Radeon 9000 with TV output. The Radeon has superior 2D and video quality, and the TV output makes it easy to integrate it into your existing A/V setup.

The SoundBlaster Live! should be sufficient for a basic home theatre setup, although if you want digital 5.1 output, then you'll need to spend another \$75 or so on a Live! DE, or \$170 on an even more fully-featured Creative Audigy DE. We haven't included speakers, as there is a massive range, from basic all the way out to multi-thousand dollar professional rigs, or you can just plug your PC into your existing home sound system.

We've also added a little more RAM to insure smooth operation under Windows XP, as well as an additional hard disk so you can store videos and music.

DIGITAL VIDEO UPGRADE SYSTEM

One area of computing that has absolutely taken off over the last couple of years is digital video. You can now get a decent quality digital video camera for around \$1,000, and your PC is the perfect platform for editing the footage.

First off you'll need a way to get the footage into your PC. If you have a DV camera, you'll need to use FireWire, or USB 2.0, to transfer the raw data to your system. FireWire cards can be obtained for as little as \$60-\$70, and USB 2.0 for around \$50. If you have an analog video camera, you'll need a video capture card to convert the footage into digital information. Capture cards start at around \$100 by themselves, but you're probably better off going for a package with a quality capture card and video editing software suite. This can cost anything between \$400 and \$2,000, depending on what your requirements are. We've recommended the Matrox RTX10 (*reviewed February 2003, page 43*) which can produce professional results for the home user. Note, however that the machine was tested with the original 32MB GeForce 2 GTS to give an indication of overall system performance, and you can see how it fares in the benchmarks on page 90.

You'll also need a sizable hard disk to store all the raw and edited footage, so we've added a 80GB 7,200rpm hard disk to the system. Drive speed is very important with DV.

Some people claim that only SCSI drives have the speed needed for DV, but these days 7,200rpm IDE disks are fast enough. As an alternative, though, you could buy two 40GB drives and a RAID card for \$150, or even better, get a motherboard with a RAID controller built in, for extra I/O performance.

DV editing is a very processor-intensive task, so we've upgraded to a KT400 motherboard with an Athlon XP 2000+ with 512MB of DDR333 RAM. This should be more than enough to do the trick, although for even faster performance, you'll want to go for one of the latest Pentium 4 systems – but it'll cost you.

3D GAMING UPGRADE SYSTEM

Back in 2001 the Pentium III 800MHz and GeForce2 GTS were powerful enough together to deliver high frame rates in all the latest games. These days, however, with games like the very CPU-intensive Morrowind, the Pentium III 800MHz is starting to show its age. Also with the upcoming DirectX 9 titles such as Doom III and Half-Life 2, the GeForce2 GTS will not support many of the advanced features, and you'll end up watching a slide show instead of a smooth game.

To boost performance to acceptable gaming levels, we've gone for a KT400 motherboard coupled with an Athlon XP 2000+ and 256MB of DDR RAM. This should give you enough horsepower to handle anything available today, and will see you through another year or so into the future. For a little more longevity, you could also consider another 256MB of RAM too.

The GeForce4 Ti4200 card is absolutely the best in terms of price/performance, and while it can't compete with the likes of the Radeon 9800 Pro or GeForce FX5900, you can pick one up for as little as \$250-\$300. As you can see from the 3DMark2002 benchmarks, the Athlon XP and Ti4200 put in a much better showing than the original 2001-era system.

We've also thrown in Windows XP Home, which is a little more stable and manageable than Windows ME.

The only other component we would strongly recommend you upgrade if you have the cash is the monitor. High resolution gaming is just not really worth the time on a 17in screen, and we'd suggest a 19in screen as a bare minimum. Prices are dropping, but you can still expect to spend \$500 for a decent screen, or \$750 for a good flat CRT.

2002 era PC

ORIGINAL SPECS

Athlon XP 1800+; VIA KT266A motherboard; 256MB DDR266 RAM; 40GB 7,200rpm ATA/100 hard disk; CD-RW combo; GeForce3 Ti200; SB Live! 5.1; 17in curved CRT; Windows XP Home

ORIGINAL SYSTEM

Last year the Pentium 4 was beginning to show its true colours as a top performance desktop CPU, but it was still squarely outmatched in the value stakes by the new Athlon processor. DDR RAM was also becoming the standard, with SDRAM finally going the way of the extinct plankton, graptolites.

With an Athlon XP 1700+, a KT266A-based motherboard and 256MB of DDR266 RAM, this system is still capable of performing most computing tasks today without too much trouble. The GeForce3 Ti200 card is also decent for gaming, although it will be put under stress shortly by the likes of Doom III and Half-Life 2. It also doesn't support all the advanced features in DirectX 9, so you'll be missing out on some great effects in the games to come over the next couple of years.

The SoundBlaster Live! 5.1 card is also pretty decent by today's standards, although the Audigy and Audigy 2 pack plenty more features if you're a sound enthusiast.

By 2002, most PCs were being shipped with CD-RW drives, and by the end of 2002, DVD-ROM/CD-RW combo drives were also starting to proliferate.

You could live quite comfortably for another 12 months with this system before it really shows its age, but don't let that stop you from spending a little cash to bring it back up to speed.

PERFORMANCE UPGRADE

The idea behind this upgrade was quite simple: bring this PC back up to full spec, and give it another year or so 'at the top'.

Most components in the system are still of good enough quality that you only have to look at the performance-based parts. These

UPGRADE SPECS

Athlon XP 2700+; VIA KT266A; 512MB PC2100 DDR; 40GB 7,200rpm ATA/100 hard disk; CD/DVD/CD-RW; Radeon 9800 PRO; SB Live! 5.1; 17in curved; Windows XP Home

QuadroFX graphics card

PRICE: \$1,000-\$3,000

ONLINE: www.nvidia.com

include the CPU, RAM and graphics card.

A new motherboard is not absolutely necessary, as the KT266A will support today's Athlon XP processors (only at a 266MHz front side bus though) and DDR RAM, but if you have the extra cash it would probably be wise to invest in a KT400 for the extra FSB and RAM speed.

Throwing in an Athlon XP 2700+ will bring this system well and truly into 2003, and will give it quite a bit more longevity. Upping the RAM to 512MB will also give you a measure of headroom, and you can see the difference these two components make in the SYSmark2002 results.

On the 3D front the Radeon 9800 PRO gives unparalleled performance and includes all of the latest 3D features as well. If you haven't got the \$900-\$1,000 for a Radeon 9800 Pro, the older 9700 Pro is still a serious piece of kit, and you can pick one up for around \$700.

The only other thing you might want to add to this system, if you have the cash, is a better monitor. 17in CRTs are looking a bit small and boring by today's standards, so a 19in CRT, or even a 17in TFT, is the way of the future.

3D WORKSTATION UPGRADE

The 2002-era PC already has a reasonable specification and some good quality components, so this makes a good starting point to build a powerful specialist 3D workstation.

3D applications like 3ds max, Lightwave and Maya are all incredibly CPU and graphic card-intensive, so you really need a

Philips 109P420

UPGRADE SPECS

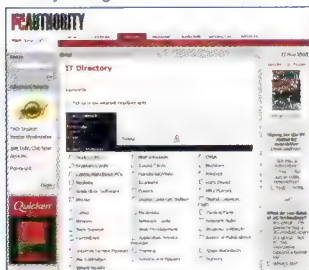

Pentium 4 2.53GHz; i845PE motherboard; 512MB DDR266; 80GB 7,200rpm ATA/100 hard disk; DVD-ROM/CD-RW; QuadroFX graphics card; SB Live! 5.1; 19in CRT; Windows XP Home

SHOPPING AROUND.

Note that these prices are only a guide, and you might be able to shop around and get even better prices.

For a comprehensive listing of Aussie dealers check out PC Authority's IT Directory at www.pcauthority.com.au/dealers.asp, which can be searched by both product and by location Australia wide.

If you can't find a distributor for a particular piece of hardware, head over to the component manufacturer's Website and check out their list of regional distributors. If you're still having trouble, contact them directly by email or, if all else fails, check with Google. Google knows (just about) everything.

Special thanks go to AMD (www.amd.com) and Achieva (www.achiva.com.au) for supplying us with components for testing.

powerhouse in order to work well. The Pentium 4 is still more expensive than the Athlon, but it clearly delivers the best performance. We've opted for an Intel 845PE-based motherboard with a Pentium 4 2.53GHz CPU with Hyper-Threading (HT). HT is a new processor technology that more efficiently uses the CPU's resources to specifically take advantage of multitasking environments and multi-threaded applications. The best thing is, most 3D applications are natively multi-threaded, so you'll get the most from HT straight out of the box.

Whacking in 512MB of RAM will also allow you to manipulate large files without slowing down to access the page file.

On the 3D front, you need serious 3D graphics card power. Professional 3D applications utilise OpenGL for on-screen rendering, and a professional-quality 3D card, such as a monsters like a FireGL or 3Dlabs Wildcat card will be optimised for this kind of

work – although you can expect to spend up to a few thousand dollars one of these cards. In lieu of that, we have opted for a mid-range card, in the NVIDIA Quadro4 XGL, which is optimised for professional 3D, but is reasonably priced.

We ran the original system, with its GeForce3 Ti200 against the upgraded system in the professional 3D benchmark, SPECviewperf, which runs through a variety of full-on pro 3D applets, including 3D modelling, CAD/CAM and stresses the OpenGL subsystem to the max. If you take a look at the results, you'll see why a specialist 3D card is the way to go in professional 3D.

Otherwise, the only other component we recommend is a minimum of a 19in CRT or 17in TFT (or two) to give you the optimal viewing area. It's just not worth doing professional work on a 17in CRT. A 19in monitor will also give you comfortable viewing at up to 1,600 x 1,200 resolution. ■

Davey Winder explores the moves that brought artificial intelligence out of the labs and into the black and white world of popular science.

Chess and computers have a long and, if you'll excuse the pun, chequered history. Perhaps the first chess-playing machine was The Turk back in 1769, invented by Baron Wolfgang von Kempelen. The Hungarian engineer built his mechanical chess player for an Austrian Empress who was said to be most impressed, as the moustached life-sized model beat all challengers. So successful was the machine, and those that followed, that they enjoyed fame into the 19th century, despite the fact that it was a fraud — a chess master hid in the box base and controlled all the movement.

In more recent years, and deserving perhaps a little more respect, was the memorable match between Garry Kasparov and the IBM-developed Deep Blue computer. This was the first time a computer

had beaten a world champion, a grand master, and some might even say the greatest exponent of the modern game.

But was Deep Blue so different from The Turk? Sure, IBM invested big bucks in developing the parallel-processing monster with 400 chess-specific chips and the ability to search 200 million positions per second. Yet there's good ground to argue that it was ultimately still more a case of smoke and mirrors than a true reflection of computerised thought — that Holy Grail of AI that is both craved and feared. Back in May 1997, Kasparov even described Deep Blue as 'playing like a God' in some situations, but the truth was more down to Earth.

The year before, Kasparov had convincingly defeated Deep Blue

and so went into the contract negotiations and the match a little overconfident, which is borne out by a closer look at the contractual side of the contest. This agreed that Kasparov would have access to all the IBM machine's public games, essential at this level of chess, where grand masters will often study every tournament match in the opponent's history in order to best grasp their strategies and reveal their weaknesses.

Unfortunately, apart from the one match against Kasparov in 1996, Deep Blue hadn't played any games in public, with all its training and learning going on behind closed doors at the IBM research labs.

Kasparov was told there was nothing to provide when he asked for this important information. In effect, he was entering into one of the highest-profile chess matches ever, blind. Deep Blue, on the other hand, had not only seen all of Kasparov's games, but had them sitting in its memory. If this wasn't bad enough, the negotiated match terms allowed IBM to adjust the Deep Blue program between games. The importance of this became apparent during the second game when it chose an unexpected defensive move instead of capturing an exposed pawn. Kasparov and the entire higher echelons of chess were shocked as to how the computer could have had such strategic foresight to defend while ahead, reducing the chance of counter moves by the opponent.

The truth is that IBM tweaked Deep Blue to allow for its failings in the first game. The in-between game tweaking continued and the rest is history, but it left a big question mark over the actual importance of Deep Blue in the field of AI.

Indeed, it may well be the case that the Russian mathematician Alexander Kronrod was right in 1965 when he predicted that computer chess would be the *Drosophila* (the much-experimented-upon fruit fly) of AI. 'Computer chess has developed much as genetics might have if the geneticists had concentrated their efforts starting in 1910 on breeding racing *Drosophila*. We would have some science, but mainly we would have very fast fruit flies.'

BEYOND THE BOARD

Certainly, there has been a continuing trend with chess machines to rely on sheer processing power in the recent past – a reliance that has eroded the scientific import of the genre but not the impact that the development of the resulting machines has on the wider world of technology and business. The IBM Research Division remains one of the main movers and shakers in the world of parallel-processing, self-regulating computer system development.

Their autonomic computing project based upon the same SMASH (Simple, Many And Self-Healing) concept used in Deep Blue includes the likes of Blue Gene. This MPP (Massively Parallel-Processing) system builds on the lessons learned by the development of the chess computer and is used in the field of genome mapping, for example. Not that Deep Blue was ever just a glorified calculator – as if anyone with any appreciation of the art of technology could ever describe a massively parallel RS/6000 SP-based computer system thus. That underlying technology has been used to tackle highly complex and real-world computational problems in areas as diverse as cleaning up toxic waste sites, weather forecasting, financial data modelling, car design and drug therapy research – not forgetting running IBM's own high-volume, highly scalable Web server for some years.

⚙ The Brains in Bahrain match between Deep Fritz and Vladimir Kramnik was the pinnacle of a long-running battle.

Ignoring the debate over the true definition of AI, it's fair to say that, in its accepted sense, it's at the heart of numerous technologies we take for granted, way beyond the Deep Blue or Deep Fritz chess-playing machines – credit card fraud-detection systems, speech-recognition and advanced information search tools.

AI-based logistics-planning DART (Dynamic Analysis and Replanning Tool), which was used in both Desert Shield and Desert Storm campaigns, 'completely repaid three decades of investment in AI research', according to DARPA (Defence Advanced Research Projects Agency), and has now morphed into AMP (Analysis of Mobility Platform), which is currently used by the United States Transportation Command.

In the business world, which can often feel like being in a big chess game, you'll find numerical analysis systems using AI to profile the risk factors of potential customers in the financial sector, tailoring their offerings and adjusting interest rates accordingly. Rule-based decision systems are in use at superstore warehousing operations, where inspection of deliveries is key to maintaining quality and therefore brand confidence.

The AI comes in to identify the high-damage risk deliveries from the low-risk ones. For the consumer, you'll find basic AI in things like the Sony AIBO (Artificial Intelligence Bot – AIBO also means companion in Japanese). The genetic algorithms that power the robot dog's 'thinking' are straight out of the AI R&D toolbox.

PLAYING THE GAME

Advances in processing power, plus the use of parallel-processing systems, are required along with programmed lessons in chess if a computer is able to even contemplate playing the game. Without the lessons (world-class tournament computers such as Deep Blue and Deep Fritz include chess grand masters on the programming teams), even these highly specialised and powerful systems would grind to a halt in the Borgesian labyrinth that is chess. They would explore every possible move, yet never find the right one, because as far as simple ►

computer logic goes there is no 'right' move thanks to what is known as combinatorial explosion.

This concept is best explained with the example of a game as simple as noughts and crosses: for each of the first player's possible moves, the second player has eight possible responses; for each possible response, the first player has seven possible replies. To fill the nine-cell grid with noughts or crosses, there are 362,880 variations in plays. Play noughts and crosses against a computer and you'll lose, because it has no difficulty with such a relatively small database of gameplays.

It's impossible to do the same with chess, as it would mean a combinatorial explosion in an average game of 40 moves – something in the region of 10 to the 128th power (there are only 10 to the 80th power known atoms in the universe). So a computer exploring one billion gameplays per second would take around 10 to the 100th power years to fully analyse a chess game. To put that into perspective, the universe is thought to only be 10 to the 10th power years of age.

Instead, chess computers follow complex rule sets to limit the searching at each move tree – rule sets that we know as heuristics and are used today in antivirus technologies, for example. This ability, albeit a pre-programmed ability, to discount the negative branches of the move tree and so increase the effectiveness when it comes to analysing the positive moves is exactly what a human chess player does. It's called thinking, and so to this extent at least we can determine that chess computers do possess basic intelligence.

Yet a human player of Kasparov or Kramnik's standard doesn't have the sheer computational power of a Deep Blue or Deep Fritz machine, but they still manage to calculate the most appropriate move with the highest strategic value in the same amount of time. They can do this because they also possess intuition and experience. A computer may gain the latter, but there's a long way to go down the AI path before any computer will truly deserve to include intuition on its CV.

BRAINS IN BAHRAIN

In the first big man vs machine chess match since that Kasparov defeat, we saw a new computer champion in the form of Deep Fritz taking on the 27-year-old world champion Vladimir Kramnik. The German-developed Fritz combined eight Intel CPUs and just 1.5GB of RAM with some impressive algorithm programming in order to compute six million moves per second.

Unlike the Kasparov vs Deep Blue match, this time around the playing field was a little more level, in that Kramnik was allowed access to the Fritz game printouts, just as he would any human opponent at this level of the game. He was also allowed adjournments and pre-match practice against Fritz. Its developers were only permitted to adjust the first move 'opening book' scenarios between games, and Kramnik would be familiar with these already.

To make it even fairer, there was no code modification or further training allowed for the three months prior to the match, which took place on the 19 October 2002 and became known as Brains in Bahrain (www.brainsinbahrain.com), thanks to the hosts, the Kingdom of Bahrain. The match finished in a draw, with Fritz coming back in the latter stages when it could pit its machine strength of stamina against the human weakness of fatigue-induced errors.

This was borne out by the final game of the match, which ended in a draw after only 21 moves, and also when Kramnik resigned in game six when a draw was possible. While the Fritz developers were

- **1958** IBM 704 is the first computer to play chess and can manage 200 positions per second.
- **1973** Chess 4 software arrives and becomes the basis of most future development.
- **1983** Bell AT&T develops hardware that achieves 'master'-level play.
- **1985** Carnegie Mellon students develop ChipTest, the machine that would evolve into Deep Thought.
- **1987** Same students, having joined IBM, develop Deep Thought, the first chess machine using parallel processing to reach 750,000 positions per second.
- **1989** Deep Thought, with six CPU and rated at two million positions per second, loses its first match to Kasparov.
- **1990** Deep Thought II draws against Anatoly Karpov.
- **1996** IBM's Deep Blue uses new chip and speeds of three million positions per second, but still loses to Kasparov despite winning opening game.
- **1997** Deep Blue II achieves 200 million positions per second, is 'trained' by four grand masters and defeats Kasparov by the narrowest of margins.
- **2001** German chess program Deep Fritz 6 beats Kasparov and all top players except Kramnik. Deep Fritz 7 defeats all other computer opponents to win right to play World Champion Kramnik at the Brains inn Bahrain showdown.
- **2002** Brains in Bahrain match ends in a draw.
- **2003** Israeli-designed Deep Blue Junior draws with Kasparov after six rounds.

happy enough not to have lost to the world champion and to pick up US\$200,000, Kramnik can take similar solace in his US\$800,000 pot.

GOING BACK FOR MORE

Before losing to Kramnik in 2000, Kasparov was the youngest world chess champion, first acquiring the title at age 22 in 1985. His loss to Deep Blue in 1997 left some deep scars (he claims that his loss was due to human tampering with machine), and he's been hankering for a rematch since. Unfortunately Deep Blue was pulled apart, never to play again. Six years later, Kasparov got his chance to restore faith in humanity with the Israeli-designed Deep Blue Junior, and this time he was allowed to study the computer's past matches.

Junior, which IBM describes as a portable Deep Blue, has an impressive track record in the world of chess software, having gained the title of world chess champion after defeating competing AIs in Europe last year. It runs off 16 processors in serial mode and processes a relatively measly 10 million positions per second compared to Deep Blue's 256 CPU parallel processing, 200 million positions per second.

The six matches played at the beginning of this year ended in a draw, with Kasparov beating the computer once, losing once and drawing four times. It's not all bad – like Kramnik, Kasparov pocketed a healthy sum of US\$500,000 for turning up, and split US\$300,000 with Junior's programmers.

ONWARD AND UPWARD

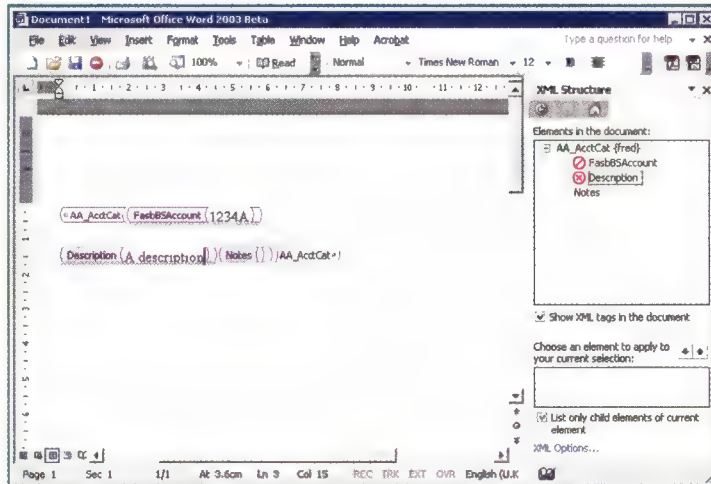

Hoping his crystal ball is in working order, Jon Honeyball looks at what could be the next Big Thing.

I'm utterly convinced that we're about to move into a completely new and exciting era in computing. Sounds like a big claim you might think, but the pieces are definitely slotting into place and there are already credible arrival dates for all the critical technologies. I've been fortunate enough to witness several such seismic shifts before, and each time there's a clear and decisive step – change in the technology and mindset.

Back in the days of MS-DOS, people did plenty of good work using applications like WordPerfect and Lotus 1-2-3, but the move to 16-bit Windows computing with Windows 3/3.1 in 1990 brought many benefits over and above the graphical user interface. Its unification of printer driver models was, for many, a huge benefit, let alone everything else that you got: unified screen drivers; a mouse-driven GUI; and finally some semblance of proper memory management.

I know there were many nasties hiding under Windows 3's memory manager, but it did allow applications to share memory in a co-operative fashion, so proper multitasking no longer required a third-party task switcher like DESQview. Most important of all, it preserved and built on the best fundamentals of the DOS era – applications were mature and robust, and we understood clearly what we were supposed to do with them. I'll hurriedly skip over the fact that many of the first Windows implementations from well-known application vendors were grotesquely badly designed, despite several years of clear demonstrations of how to write good Windows applications from products like Excel and PageMaker.

The next significant era arrived in the mid-1990s, with the shift on the client-side

Microsoft's Word working with an XML Schema from Access, with live validation and checking.

to 32-bit computing and the appearance of robust and serious server technology. Once again, this built on the best of the previous generation, and NetWare 2.x, 3.x and 4.x were important leaders on the server front. The arrival of the Internet just spurred the need for robust desktop technologies, and we were firmly into the era of Microsoft's Office suite. This same model has served us well since then, but now it's time to move forward, and the next big shift is going to start the middle of this year and push through for the next two years or so.

The key technology is XML, the extensible markup language that finally and forever breaks the relationship between information and the way it's presented. XML has been around for a while, so you're probably wondering why I'm only now proclaiming it to be the future of computing. Well, XML by itself isn't enough, and nor is the provision of development tools. For XML to change the world, it needs to impact on everyone's day-to-day computing experience, and it's here that the next pieces are falling into place. Before I get too excited, though, I should admit that

the picture still isn't fully complete, but the end-game is clear to see, the clock's ticking and it's time for us to board the train.

The Office is open

Some months ago, I expressed concern over rumors that were circulating regarding Office 2003 having a heavy XML emphasis. I was concerned largely because Microsoft traditionally hasn't been the most open of companies when it comes to new data formats (and honestly, that's putting the matter in the kindest possible language).

Take a data format like that used by Excel: from the beginning, this has been known as BIFF, for Binary Interchange File Format. BIFF is a private binary data format and it isn't published anywhere. As if that weren't bad enough, with the arrival of structured storage Office documents, all BIFF information was poured into a stream inside a structured storage file, and to get to this you had to use Microsoft's development APIs, making it doubly hard to read the data held in a worksheet. You could get a document from Microsoft that described the BIFF format, but this required signing an NDA (non-disclosure agreement) and so was only made available if you were considered 'friendly'. Just to add insult to injury, it appears that a lot of the BIFF format either wasn't documented at all or was somewhat incomplete. The bottom line was clear – Microsoft didn't want you to read BIFF files except from Excel, and the same applied to the document format of Word and the other Office applications.

Claims from Microsoft that it has now done a full 180-degree turn might rightly be treated with considerable suspicion. The initial hints of this came a few months ago ►

NEC

more, nor are the other platforms like Commerce Server. Everything is being distilled down into common shared platforms, so there will be one workflow engine, one commerce pipeline, a single application transaction server and so forth. And now we have the front-end tools, in the shape of the Office 2003 suite, to deliver a rich and meaningful experience to the desktop. It's now possible to move XML forward onto the desktop and backward to the back-end data stores too, and this is a new encompassing vision that demands serious attention.

There is, however, one major component missing, and that's storage. At this point, I have to make a leap of faith and do some speculating. If you think about it hard enough, it's a bit daft to store XML in text files called mydata.xml on an NTFS hard disk. We need a 'digital soup' store that just consumes XML data and looks after it. Well, I believe it's coming, and sooner than you might think. The WinFS (Windows File System) due to arrive with the Longhorn version of desktop Windows next summer is apparently just that, a native XML store. This timing and release pattern makes huge sense - release it on the client-side first and then follow up in the Blackcomb server release a year later, where the data loads will be far higher.

Now assume that this text file is in XML format and that it contains the Schema for something like an invoice. Inside the file you know the invoice number, the number of items, the customer reference number and so forth, all of which are properties of the information content, and the filename fred is just another of these properties, as is the

The extent to which Microsoft has managed to shoehorn XML support into the forthcoming Office 2003 product is something that surprised me. I can now sit inside Access and output some data as an XML data file and its associated Schema, load up Word and bring that data straight into it. I can work on a Word document and mark it up with XML Schema information, then punt it straight out into Excel. I can take some data from Excel and trundle it out onto a BizTalk server for queuing up into a

It's intriguing to see how Microsoft has taken a hatchet to its middle-tier engines and ripped them to pieces. BizTalk is no

directory it lives in. Imagine you had a store that reads and consumes that XML file for you, much the way a database manager would do today. Imagine you have no fixed directories in this store either, but that these were just 'stored views' or 'catalogs'. You could view the information in any way you want, and you could spin it around and view it in different ways for different purposes.

Let me give an example. If I knew how to store invoices from the XML Schema, it would be possible to see C:\company name\month\items sold\ and then see all the entries for products sold. So I might see C:\JonsCompany\January\Toothbrushes and then all the line items sold that month. However, you might be interested in the product first and thus have C:\items sold\company name\month\ and so turn this whole view on its head. We'd both be looking at the same data store, but viewing it from different perspectives. Once XML Schema and meta tags are surfaced into the store, this all becomes possible. You can see a very simple implementation of this today by going to an NTFS format store and looking in Explorer at a pile of Office documents. Right-click on the headings and choose some of the other meta tags that can be exposed. Now take this mindset and expand it up to a wholly generalised customer-defined set of schemas.

Will this all arrive with Longhorn? All the indications, plus various nudges and winks and off-the-record chats suggest it might, but it's clear that going for a unified information store is the last remaining piece of the XML puzzle which needs to be fulfilled. Hence, to come full circle, back to my opening prediction. Once we take today's middle-tier and application development capabilities and wrap in Office 2003 as a first-cut version of XML on the desktop, then fortify the rear by changing the storage to a native XML store, the transition to the next computing era will have happened.

Do you grasp just how fantastically exciting this all is? Of course, there'll be many who just don't see the point. These people will happily stay in the current OS/Office world for some years to come, in the same way that many stayed with WordPerfect and Lotus 1-2-3 well into the GUI era. I think Microsoft knows this clearly enough, but also knows that they'll be back in a few years once the dust has settled. Being a pioneer isn't without its bruises, and looking back over my

computing career I can think of times when maybe I pushed the boundaries a bit too far. But that's what I was paid to do and so 'je ne regret rien'.

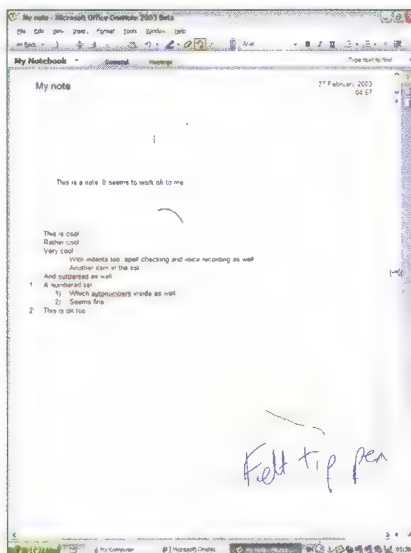

For those of you who shudder at the thought of having to make this XML world work, rest assured that there's still plenty of short and medium-term future for the status quo. Just don't be upset if some of us hitch the horses to the wagons and head west. . .

OneNote

I've just installed OneNote onto my Compaq Tablet PC, and it's utterly compelling. Such clarity of thinking, such fantastically straightforward problem solving – I'm completely hooked. Go into a meeting, put the Tablet on the table and press the record button. Record the entire meeting and have all of your typings, jottings and scribbles time-stamped. Return to your desk, sync the information to your desktop and main servers and open the file up there.

Click on the little loudspeaker icon next to any item and it plays the sound recording around the time when you made that entry. There's no object model, no macro language, no XML data store (yet). It's a very simple design in this first release, but still a joy to behold, and it comes from the Word group at Microsoft, clearly showing how they're prepared to 'think out of the box' when it comes to new ways of working with information. I

⬇️ OneNote – the application that really defines the Tablet era is fantastically straightforward.

hope this doesn't get sidelined by inter-departmental rivalry.

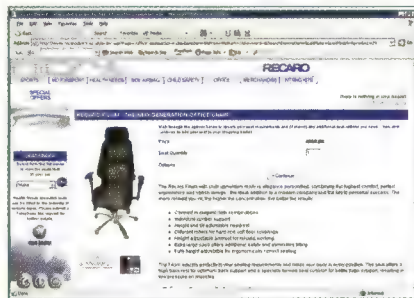

In truth, some child of OneNote ought to become the universal canvas and active surface of your desktop, laptop and PDA in the future.

A chair for Windows

I'll admit this sounds a bit silly, but finding a decent office seat is incredibly difficult. The cheap ones seem to be too flat, too hard, too slippery or just plain uncomfortable. That ubiquitous Herman Miller 'Aeron' chair smacks too much of dotcom madness. Years ago, Recaro, the company famous for its car seats for road and race vehicles, made a ferociously expensive office seat called the IdealSeat C, which consisted of a top-of-the-line Recaro car seat mounted onto an office base. I didn't buy one then, pleading poverty, but I've regretted it ever since. Good posture isn't optional if you spend hours in front of a computer.

So you can imagine my delight that Recaro is making them again, and you can order direct from www.recarodirect.com. I chose the fabric model called Filum and it's fantastic – supportive, comfortable and holds me in place as I swerve around the keyboard at high speed trying to get overdue articles written (sorry, Mr Editor!). Treat yourself, your back will love you forever.

⬇️ The ideal upgrade for a serious workstation – a proper chair!

with the greatest of ease.

If you want to extend your existing Ethernet network or set up a new network quickly, easily and affordably, NETGEAR wireless is the answer.

Wireless technologies allow you to build a network for speed and mobility without the inconvenience of installing cabling. Easily integrate wireless and Ethernet wired technologies using an access point or choose a wireless router for a faster Internet connection.

Consider the latest in secure wireless communications with NETGEAR's new 54Mbps wireless technology. These products are ideal for companies and individuals seeking a high speed wireless networking solution that enable multiple computers to share files, peripherals and access to the internet easily.

NETGEAR manufacture a range of wireless products to support 802.11b, 802.11a and the newer 802.11g* standards.

EXTENDING ILLUSTRATOR

Tom Arah looks at the full range of add-ons available for Illustrator 10, and lets us in on some of their features.

The ability to extend Adobe Photoshop's functionality through the use of plug-ins is well recognised and most designers will have at least a couple of third-party filter sets in their armoury. Adobe Illustrator offers similar extensibility, but its vector-based plug-ins are hardly known, with none of the brand recognition of KPT or Eye Candy 4000. I decided to find out what's out there by trying ten Illustrator 10-compatible add-ons.

Illustrator extensions don't have to break the bank. Visit the Sapphire Innovations site (www.sapphire-innovations.com) and you'll find a host of filters, brushes and shapes, all the work of Andrew Buckle.

The range is impressive, but the downside is you can easily feel lost. Dig a little, however, and you'll find Andrew's 11 sets of Illustrator add-ons, costing from just AUD\$20 up to AUD\$100. Finding out what they all do is more difficult, as some have broad themes, while others are mixed bags. Bewilderment might continue even after you've installed your add-ons – Andrew clearly prefers to spend his time on developing new functions rather than documentation or streamlining.

Take the very handy Symbol Paint tool (volume eight), which paints with symbol instances – its dialog lets you adjust no less than 30 parameters. Some of these can be intimidating but are definitely worthwhile. The mysterious Hit Type/Request parameter, for example, allows you to restrict your painting to selected objects or paths. Other hidden gems include the Random Clutter, Random Text and Perspective Grid tools, and at around AUD\$150 for the entire collection it would be churlish to complain. Having said that, most users would probably prefer a little less control and a little more usability.

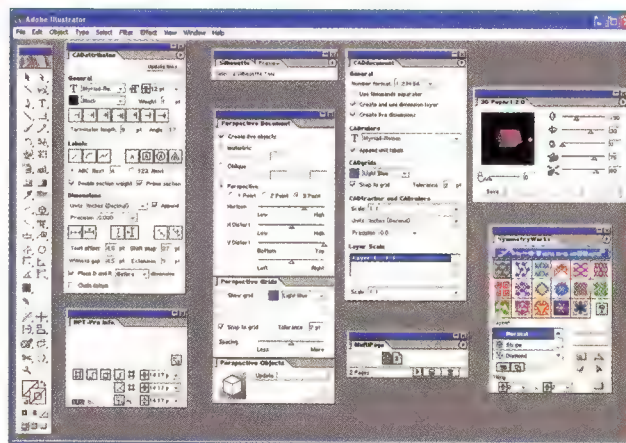

An excellent example of a budget add-on that's both simple and effective is Hot Door's MultiPage (AUD\$77 from www.hotdoor.com). This offers a simple floating palette in which you add new pages and select the page on which you want to work. You can print any page selection or export it to PDF using new File menu commands.

Multiple page handling must top most Illustrator users' wish-lists, and you're forced to wonder whether MultiPage is too good to be true – is it just a trick? In a way it is. Behind the scenes, it works its magic simply by treating layers as pages. Whenever you create a new 'page', a new layer is added – with the relevant guide layer acting as master page – and all other layers/pages automatically hidden. This becomes obvious if you add a layer in the Layers palette, because a new page appears in the MultiPage palette too, but if you stick with sublayers you'll be fine. Let's hope Adobe sees sense with Illustrator 11 and finally scraps its artificial and maddening single-page limit. Until then, MultiPage provides an extremely handy workaround.

Equally simple and efficient is Vertigo's 3D PopArt 2 add-on (\$110 – from www.vertigo3d.com), which transforms any selected path into a shaded 3D object. Again, it's a simple floating palette that lets you define the extrusion depth, rotate your object in X, Y and Z dimensions and set a lighting angle. As you change settings, a small preview cube is updated correspondingly; when you hit Apply, the effect is applied to the current path. It's nowhere near state-of-the-art compared with CorelDRAW's and FreeHand MX's extrusion capabilities, but it's all you'll need to produce the occasional 3D shape or heading.

High-end products

The add-ons so far all fall into the category of occasional one-off use – with prices to match – but other developers are targeting niche markets with more advanced and professional functionality. For example, Artlandia SymmetryWorks 2 (AUD\$260 – from

➤ Plug-ins take Illustrator into a new and sometimes unrecognisable territory.

www.artlandia.com) is aimed at users for whom pattern making is a central part of their work. Its basic principle is simple: select a path or paths, click on any of the 17 coloured icons in the SymmetryWorks palette, and multiple copies of your object(s) are rotated, glided and reflected to produce a symmetric pattern.

The beauty of this system is that patterns remain live so you can keep adding X or Y tiles to fill the space required. More importantly, you're able to edit the original 'seed' pattern, for example, by resizing, repositioning, recolouring or adding a new element, and the overall pattern gets updated. You may also add editable cloned 'replicas' of your seed and save these, together with the transformations that you apply to them, as 'layouts'. Working in this way, it's possible to control step and sliding effects, gradations and so on and produce virtually any kind of repeating pattern. There are lots of power features for advanced users, but I wish Artlandia also offered a cut-down 'lite' version, as its basic symmetry effects offer plenty of creative power.

Another important niche is the production of perspective drawings. The simplest and most powerful solution is Perspective, again from Brendon Cheves and the developers at Hot Door (AUD\$285 – from www.hotdoor.com). ▶

Notebook Manufacturer Since 1986

Twinhead, IMPAX and Two Steps Ahead are registered trademark of Twinhead Corporation. All registered trademarks and logos are the property of their respective owners.

MultiPage and PopArt 3D are simple but effective.

The SymmetryWorks and Perspective plug-ins are high-end solutions.

It comes as several dedicated drawing tools, including the most obvious cube and cylinder options, plus three palettes.

In the first palette, Perspective Document, you choose the type of dimensional drawing you want to produce from isometric, oblique and perspective options. In the second, Perspective Grid, you define the spacing and colour of your grid. The third palette, Perspective Objects, is most impressive, showing a small thumbnail of a cube. By selecting one of its faces and then hitting the Update command, you can automatically project your currently selected object(s) onto the appropriate plane, creating a true perspective image at a stroke. Most impressive of all, this artwork remains in perspective and live, so if you change the grid settings – say, from isometric to oblique, or back to head-on for editing – the artwork automatically updates.

Hot Door also has a solution for producing technical drawings. CADtools 2.1 (AUD\$315 – from www.hotdoor.com) isn't as eye-catching

as Perspective, but it offers four comprehensive setup and control palettes and a range of 38 drawing and dimensioning tools. Highlights include automatic callouts with dimension and label styles, numeric input and control, customisable document scales, and scaled move, transform and repeat capabilities.

One of the most common tasks for Illustrator users is tracing scanned bitmaps to produce truly scalable and pin-sharp vectorised versions, for example, if you're involved in exhibitions or producing large-format signs. This is where LogoSpruce (AUD\$315 – from www.comnet-network.co.jp/eng) comes in, offering a range of tools for tracing imported bitmaps. I expected these to offer automatic image tracing, but that's not what LogoSpruce is about; for example, the Line Trace tool is designed to let you, wait for it, draw straight lines!

After my initial horror, I gradually came to appreciate what LogoSpruce does. To start with, there's a whole range of tools to assist the manual tracing process, including adding one-click guides and the automatic straightening of imported bitmaps. The tracing tools themselves include a number of useful and innovative options like adding perfectly smooth curves at a tangent to the current line. Even LogoSpruce's line tool is far more powerful than Illustrator's own, as it automatically identifies endpoints, midpoints and tangent lines, lets you swap between tool variations and zoom in and out on your image using keyboard shortcuts. Finally, there's another set of tools designed to correct your artwork, including a Trim tool that automatically deletes a line back to the nearest intersection. All told, LogoSpruce offers a comprehensive and well-thought through range of functions for reproducing raster artwork as clean vectors.

If you'd still prefer a tool that does the work for you, there's another plug-in that fits the bill. The Silhouette plug-in (AUD\$244 – from www.silhouetteonline.com) is built on the same tracing engine as the well-respected standalone Silhouette application (only available for the Mac). Select the new Vectorize Raster Image tool and use the Silhouette palette to set tolerances, choose black-and-white or colour and, if the latter, whether you want to trap

coloured objects so they overlap slightly. Once you've chosen your settings, click on the bitmap and a second or so later the vectorised version appears automatically.

The problem with such automatic tracing solutions, as LogoSpruce has realised, is that it can take longer to clean up the results than to reproduce the artwork from scratch. Silhouette comes into its own here with a range of dedicated correction tools for automatically aligning control points, sharpening corners and smoothing and simplifying paths. The Silhouette palette even offers a large Preview window where you can see what effect your tool settings will have before you apply them.

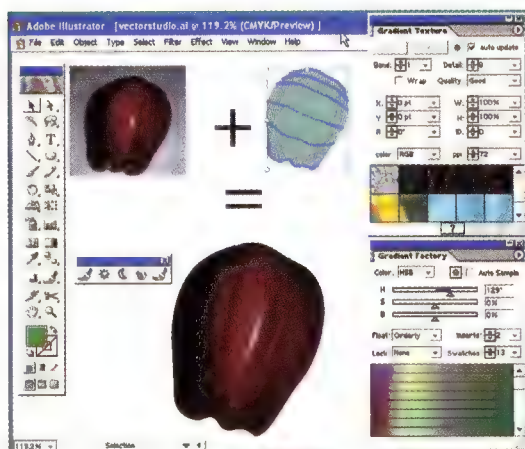

Standalone?

Silhouette's unique combination of automatic tracing and dedicated correction is impressive, but you have to ask yourself whether you wouldn't be better off with a standalone solution such as Adobe Streamline. The same could be asked of other professional plug-ins aimed at niche markets. For perspective work, wouldn't you be better off using Macromedia FreeHand? For CAD, wouldn't you be better off with Corel DESIGNER? There's certainly a lot of sense in asking the question, and if you're not already an Illustrator user, the answer is a definite yes.

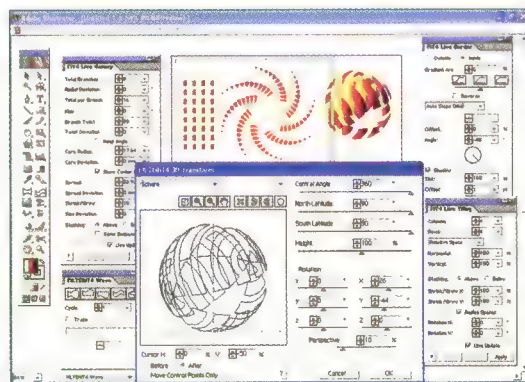

If you are an existing user, though, there are plenty of advantages to adding the extra power right there in your preferred drawing environment (and one which offers such power, creativity and integration). And while these plug-in developers might not be household names, I was surprised at just how professional and workable their products are. But in the end, the unbeatable benefit of these small developers is that they know exactly how Illustrator is used in real-world production environments and how to make the most of it.

In between these budget one-off plug-ins and high-end targeted solutions, there lie two standout collections that manage to provide such wide-ranging new functionality and creativity that they are, in effect, third-party upgrades for Illustrator. The first is Vector Studio 2 (AUD\$205 – from www.virtualmirror.com). I was a big fan of the first release, which introduced a number of features such as interactive Morph Brushes, Envelope Meshes and the non-destructive application of bitmap filters. Adobe was clearly impressed too, as it bought Virtual Mirror's distortion-based tools and implemented its own envelope and filter handling.

After Illustrator had incorporated the main ►

Vector Studio 2 pushes back creative boundaries.

FILTERiT4.1 offers the widest range of new tools, commands and effects.

highlights of version 1, version 2 was never going to be quite such a 'must-have', but it's still remarkable. Two palettes for improving Illustrator's existing gradient handling and for adding a whole new style of gradient-based texture have survived from the first release, along with the ability to apply effects as lenses. There are also new tools to improve shape editing and simplify paths, plus the ability to arrange and save palette layouts.

More eye-catching are the new Retouch brushes, which let you change the brightness, hue and saturation of objects and gradient mesh nodes simply by painting over them. Even more powerful and innovative are the new Sampler tools, where you can change an object's colour, transparency and even size, based on sampled object settings, gradients and even imported bitmaps. It takes a while to get your head around just what these Sampler tools are able to do – for example, cloning an imported bitmap as coloured and sized halftone dots – but their creative power is undeniable.

One plug-in collection that I hadn't come across before is FILTERiT4.1 (AUD\$205 – from www.cvalley.com). Again, the range and the depth of features on offer stand out. In FILTERiT, these are divided into three main sections: new tools for Illustrator's toolbar, new commands for the Filter menu and new 'live effects' controlled from their own palettes.

Looking at the Wave, Warp, Roughen, Lens, Broom and Craft (pinch and punch effects) tools, it's clear that like Vector Studio FILTERiT also pioneered interactive distortion effects for Illustrator, although now Illustrator offers its own versions their benefit is obviously much reduced. However, FILTERiT has cleverly given its tools a new lease of life with a 'trace' capability that produces multiple copies of the object in between its original and filtered states. Other new tools include AlignPoints options that let you quickly straighten lines and align objects horizontally and vertically, and the Trail tool, which leaves copies of the current object along the path that you drag – useful for Flash animations.

My favourite tool is the MetaBrush, which works rather like Sapphire Innovations' Symbol Paint tool but with any object or objects. Select your objects, then the brush,

and begin painting with them. For greater control, you can set the space, size, angle and orientation of the added objects and decide how these settings should vary based on pressure, direction, number of steps and so on.

FILTERiT's two added Filter menu commands show just how much power may be packed into an add-on. The first, Fractalize, adds new path segments to the paths of selected objects, of a shape, number, height and variation that you select. You can apply the same process to the added segments themselves, producing self-similar fractal-style effects. As with many FILTERiT tools, the settings can be saved as presets and the Fractalize command can also be applied non-destructively from the Effects menu.

More powerful still is the 3D Transform filter. By dragging in the preview window, you can rotate an object around the X and Y axes and, by Shift-dragging, around the Z axis. You may also specify a 3D rotation both before and after the transformation is applied. The real

power is seen when you select from the 12 types of transformation on offer, each with a host of controls. Whether you're producing a simple perspective change or an eye-catching 3D spiral, the power is all here (the obvious omission being realistic shading).

What gives the FILTERiT collection its final edge is its range of 13 effects, each controlled from its own palette. The effects are broadly split into two categories. The first group – Border, Cutout, Emboss, Neon and Shadow – is concerned with controlling the appearance of the selected object's path and works by duplicating, recolouring, blending and offsetting objects. Such effects are relatively common and Illustrator offers its own shadow and glow effects, but FILTERiT provides greater control and keeps its effects vector-only.

The second range – Circle, Explosion, Frame, Galaxy, Generation, Reflections, Tiling and Trail – is also built around duplicating the selected object, but this time using the duplicates to produce patterns. These effects act almost as the cut-down version of SymmetryWorks I was wishing for earlier, and – as with SymmetryWorks – their great strength is that they remain live so you can always change settings. For example, you could change the offset and shadow of the Border effect's bevel or add copies and change the spread of the Explosion effect.

FILTERiT stands out from the crowd, but in many ways it's typical of all these third-party plug-ins. In particular, its combination of tools, commands and live effects shows the unique benefit that Illustrator offers to its third-party developers – complete integration. By comparison, Photoshop plug-ins seem semi-detached at best.

Having said this, FILTERiT is also typical in that its effects can be demanding to come to grips with and aren't suitable for occasional users. In fact, all these Illustrator plug-ins, with the honourable exceptions of MultiPage and PopArt, tend toward the technical and can be difficult to master. Once you've mastered them, though, each plug-in rewards the effort by seriously boosting productivity and creativity. ■

New in version 11 is batch conversion of Microsoft® Word® files to WordPerfect® files

New in version 11 is Classic Mode with blue screen, and WordPerfect® 5.1 keystrokes

You can publish direct to PDF in both WordPerfect® 11 and Presentations® 11

If you compare them with us, you won't notice many differences.

Not a lot at all.

Except the price. Except that we publish direct to PDF. Except that you can choose to work in Classic mode with blue screen and WordPerfect® 5.1 keystrokes. And except that our slide shows, spreadsheets, and WordPerfect® documents can be published to XML.

In fact, except for a whole lot of extra features.

With the launch of the brand new WordPerfect® Office 11 we offer file sharing capabilities with Microsoft® Office. Gosh, we even have the same Word® and Excel® toolbars so you won't need to spend time finding your way around.

The differences are now in the extra features.

Learn

more about these new features by visiting us at www.wordperfect.com today.

For the details of your nearest stockist please call +612 9006 1119.

To purchase via the telephone and to have it quickly delivered straight to your door please call ITD Logistics on 1800 220 045, or e-mail on product@itdlogistics.com.au today.

For corporate sales or licensing enquiries call +612 9006 1122, or e-mail jake.sharpe@corel.com today.

The difference between us and them is now one of choice.

Open and save documents in Microsoft® Word® format, like them

Easily access your Microsoft® Outlook® address book, like them

Publish your work direct to HTML to add pages to your web site

Open and save worksheets in Microsoft® Excel® format, like them

Work with the familiar Microsoft® Word® menu bar, like them

Publish suite wide to XML and output to SGML from WordPerfect®

Open and save your slides in Microsoft® PowerPoint® format, like them

Create your own menus and toolbars

Included is the Pocket Oxford® Dictionary

Add MP3 sound to your presentations

Publish direct to PDF with bookmarks

Enhance workflow with Collaborative Review

Create tailored solutions with Microsoft® Visual Basic® like them.

With WordPerfect® Office 11, regard-

less of your ability, you have a choice of keyboard, mouse, toolbars, and also shortcut settings which will allow you to work in the manner which is more comfortable, and also more efficient, for you.

You best know how you want to work, not a large corporation.

You also now have the choice to pay a price which is much more comfortable for you.

\$935* for them. \$299** for us.

*In the April 2003 magazine edition of the Harris Technology catalogue the cost of Microsoft® Office XP Standard was quoted at \$928, including tax. It may be sold for less. **WordPerfect® Office 11 upgrade or cross-grade costs \$299, full version costs \$649, both including tax. The following Microsoft® Word® file formats can be opened in WordPerfect® 1.0, 1.1, 1.2, 2.0, 4.0, 5.0, 5.5, 6.0, 7.0 (Microsoft® Office 95), 97, 2000, and 2002 (Microsoft® Office XP). The following Microsoft® Excel® formats can be opened in Quattro® Pro, 3, 5, 7, and 97. Microsoft® Word®, Excel®, PowerPoint®, and Outlook® are trademarks or registered trademarks of Microsoft Corporation. If you own Microsoft® Office 2000 or higher, Microsoft® Works, Microsoft® Works Suite 2000, WordPerfect® Suite 8, WordPerfect® 8/9/10, WordPerfect® Office 2000/2002, or Paradox 8/9/10 you can take advantage of this new offer now by upgrading, or cross-grading to WordPerfect® Office 11. A SIGN OF THE TIMES

Mike MacCana loads up on hash and examines some suspicious packages.

I've spent a fair amount of time recently training network administrators familiar with Windows to work with Linux.

Part of this has meant taking another look at Windows/Linux integration – there's a lot been happening in this area recently, particularly the release of Windows 2003 and the beta releases of Samba 3. By the time you're reading this you'll no doubt know all about the former. Readers of this column should also recall Samba, an Open Source suite of utilities to interoperate with Windows systems. Currently, Samba provides the following:

- The ability to share printers and files with Windows' systems
- The ability to mount Windows shares and print to shared printers
- Authentication against Windows domain controllers
- Provide Windows NT4-style Domain Controller support
- WINS name service support for legacy Windows clients
- Support for Windows popup messaging and more.

Samba is reliable and very capable, having served many of my clients for years at a time. Samba 3, which is currently in beta, expands upon those capabilities significantly, using Windows 2000/2003 style methods of doing things that the current version only does in an NT4-like manner. A good deal of that is due to Samba 3's Active Directory support. If you're a Unix guy and have no idea what Active Directory is, rest assured it's nothing to be afraid of – just a collection of the following technologies:

- LDAP (Lightweight Directory Access Protocol) using a particular schema defining the properties necessary and optional for Windows objects – like users, computers, etc – to be stored within the directory.
- A Kerberos-like authentication scheme
- Time-syncing via NTP (Network Time Protocol) to keep clocks in sync between

authenticating clients and Kerberos Domain Controllers

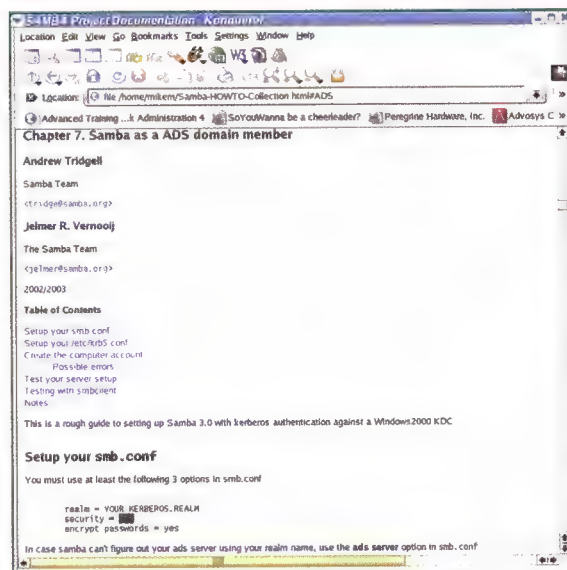

- A DNS-based system naming and service location scheme, including SRV records, dynamic DNS, and encrypted zone transfers
- Proprietary Windows RPC to deal with various additional functions.

In my test network I currently have a Linux machine syncing its clock from a Windows 2003 server using NTP, getting a machine account from the 2003 machine using Kerberos, appearing within the Active Directory Users and Groups tab, and authenticating users logging on using Windows domain credentials. There are a few hiccups – Microsoft DFS (Distributed File Server) server support, which abstracts the names client PCs and scripts use to access shares (like //server/share) from the servers where the shares reside, allowing IT staff to move resources without modifying client-side configurations.

When Samba 3 goes stable, you'll hear about it here first (you can pick up packages for Red Hat 9 at www.cyber.com.au/users/mikem in the meantime). But there's a bunch of other new technologies that have come out recently to make adding Linux machines to your Windows network, or vice versa, a much easier task.

Hash

One of the things I find curious about Samba are the various ways of dealing with the way Windows and Unix store passwords. Neither Windows nor Linux store actual user passwords on disk – if they did someone who breaks into a machine could break into other machines where

➤ The official Samba website provides a comprehensive guide to working with the current Samba 3 beta

users used the same passwords.

Instead, operating systems put the users' passwords through a process called a one-way hash to produce a mathematical derivative of that information, called a hashed password. A hashed password is a big sequence of unintelligible gibberish that bears very little resemblance to what you typed in (take a look at your /etc/shadow file to see some).

A given password for any particular user will always produce the same hashed password when run through a one way hash process.

So how does hashing protect the original password? It's very easy to calculate a password hash from the password a user enters, but it takes much, much, much longer to calculate the original password from a hashed version. When a client needs to authenticate, it asks the user for their password, hashes the password, and then sends the hash to the server. The server then compares the hash sent by the client to the hash stored on disk. If they match, ➤

Want the world to go faster?

**Introducing Corsair Xtreme Memory,
for a Faster Gaming Experience.**

CORSAIR XMS3500 DDR

- ▶ Memory bus speed: 434 MHz (PC3500 - fastest DDR).
- ▶ Each module is tested at least twice before shipping in the most recent hottest gaming/overclocking motherboards.
- ▶ 6 layer controlled-impedance PCBs with 30 micro-inches of gold on the pins.
- ▶ The world's fastest memory, according to countless independent reviews.
- ▶ Ultra-sleek, distinctive aluminium heat spreaders, ideal for overclockers.
- ▶ Life Time Warranty.
- ▶ Made In USA.

XMS Memory Modules, ideal for use in the new Dual Channel AMD and i865 & i875 INTEL chipset motherboards.

Soar to Success

The problem is that Windows generally uses MD4 format hashes, whereas Linux uses MD5. If you have both operating systems authenticating as they usually do, you'll need to store password hashes in both formats for them to authenticate. Why doesn't Linux use MD4? Well, the people who invented MD4 don't recommend anyone use the format. Windows uses it mainly for legacy reasons, but encrypts the part of the OS where the hashes are stored as a (partial) workaround.

Authenticating Linux machines with Windows servers

- PGina's Windows interface is documented on MSDN with the expectation that third parties will use this to plug in their own authentication systems.

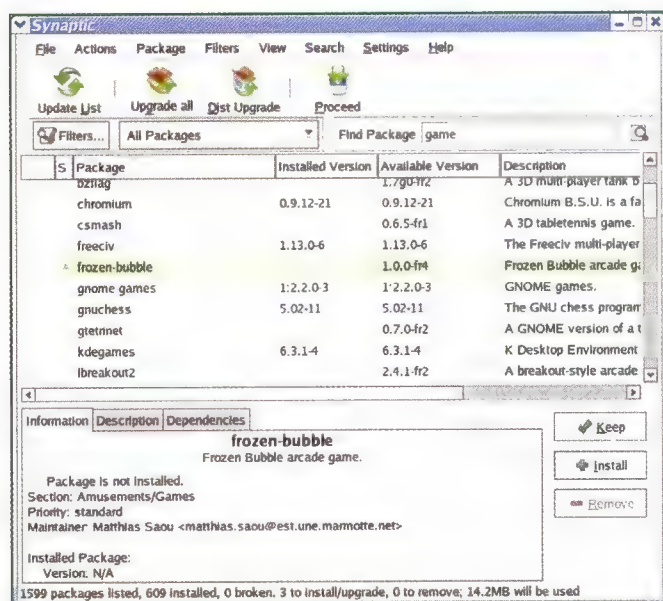

- ## Authenticating Windows machines with Linux Servers

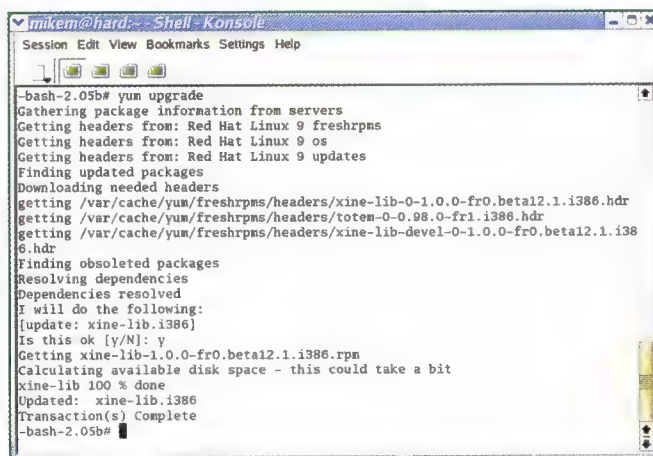

- The image is a screenshot of a web browser displaying the SecurityFocus website. The browser's address bar shows the URL 'http://www.securityfocus.com/infosec/1563'. The website's header includes the 'SecurityFocus' logo and a navigation menu with links like 'Home', 'The Basics', 'Microsoft', 'UNIX', 'IDS', 'Incidents', and 'Virus'. Below the header is a banner image with the text 'NETSCREEN'. The main content area features the article title 'Active Directory and Linux' by David 'Def' Ehon, dated April 3, 2002. The article's introduction discusses the use of Microsoft's Active Directory as an authentication service for Linux systems, noting that while Linux has OpenLDAP, it may be desirable to use Active Directory for authentication. The article also mentions the PAM/NSS mechanism and the Solaris system. The browser's status bar at the bottom shows the page title 'Active Directory and Linux - Kongqueit'. The overall layout is typical of a web browser from the early 2000s, with a clear distinction between the header, navigation, and main content areas.

- logon support for (pure, non-Microsoft) LDAP PGina replaces MSGINA, and allows LDAP and NIS to replace the Windows logon service (the thing you see after pressing <Ctrl+Alt+Delete> on a Windows machine). Sound like a hack? It isn't. The interface PGina uses to talk to Windows is also used by the Windows Netware client, and is documented by Microsoft with the expectation that third parties will make their own authentication systems – in other words, it sits at the top of a pretty solid foundation. I have friends using PGina in medium scale (400+ client PCs) networks and apparently it will handle larger networks as well.

- Set up both MD5 and MD4 encrypted passwords on the Linux server. This can be on the local disk (MD5 hash for Linux clients in `/etc/shadow` and an MD4 hash for Windows clients provided by Samba in `/etc/samba/smbpasswd`), in an LDAP directory, or elsewhere. The main disadvantage here is that users will have to re-enter their account details, as the input for one kind of hash can't be recreated by another.
- Make Windows clients use non-encrypted passwords. This was once a common practice, but is now quite unusual. In this case, the passwords are sent in clear text

⬆ The APT-based package downloading front-end Synaptic has had a sharp cleanup.

⬆ Yum's a simple, fast, and reliable command line updating tool.

over the network, and the Linux server does the hashing.

been showing this off to the students in the training course I teach and everyone's been quite impressed with the tool.

However there's another application, Yum, that's recently emerged as a solid contender for installing and updating software on RPM. Yum is highly inspired by up2date and APT, but has a few advantages. Package updating programs like up2date, APT and Yum maintain an index of available packages, which must be updated with any recent releases for them to do their work. However, a tool like APT will fetch new indexes for every package in a particular group if a single new package is added. Not much of a big deal per se, but the size of these indexes gets pretty large, and hence the process can take a while. Yum's a fair bit cleverer – fetching headers only for new packages. Because of this, Yum (like up2date) automatically refreshes its indexes every time you go to install something – but unlike up2date (which also does this), it doesn't take forever. And you can use it to install third-party software, building your own local repository if you wish.

Yum's also a much smaller application than APT – a good thing for most Unix users, who regard smaller apps as more reliable (in the sense that since there's less code, there's less to go wrong). You can fetch Yum packages for Red Hat at www.freshrpms.net.

Some people think the security effects of this action are negligible – as MD4 encryption already has a variety of known flaws and is no longer regarded as secure by its authors. However, Microsoft no longer tests or supports unencrypted passwords and I still think that even MD4 encryption is still better than clear text. When non-encrypted passwords are passed to Samba, the standard MD5 password hashes are used. You can enable plain text passwords on Windows clients, by applying a registry change from the REG files located in `/usr/share/doc/samba(version)/docs/registry`.

APT Dance

I've been getting quite a bit of mail from readers of late. I'm endeavouring to reply to as much of it as I can, but if I'm a little late, be patient. One of the things quite a few people have mentioned is how happy they've found the Advanced Packaging Tool, or APT, which fetches and installs packages and their dependencies. Reader, M Larsen notes 'with the help of the Synaptic GUI, APT makes it all too easy to download and upgrade packages through public repositories. It computes dependencies automatically and makes it easy to install, uninstall, and update all packages on your computer. It's definitely worth the download.' I've mentioned APT here before, but there's been a few developments in this area which readers may be interested in. Firstly, Synaptic had a couple of facelifts, and now has a much simpler, polished, Gnome 2 interface. I've

AUDIO ON THE HOOF

Today's portable PCs have more computing power than ever. Brian Heywood shows how you can use it.

When I was in Melbourne last year doing some recording, my reliable, though aged, Dell Latitude Portable PC got fried by a lightning strike. As Dell wasn't prepared to support such an old machine, I had to get a replacement at fairly short notice and ended up with a Compaq Presario, happily 'on special' in the local computer emporium. While it doesn't have a particularly whizzy spec compared with today's state-of-the-art notebook PCs, it's far more powerful than my old Pentium 133MHz laptop and has a much bigger screen as well.

I used my old portable mainly for office tasks like word processing and collecting my email, but it didn't have enough power to be considered for any kind of serious audio tasks, apart from MIDI sequencing and perhaps a bit of simple WAV file editing. This was as much due to its dearth of hard disk space (800MB) as to its relatively modest processing power. I did use it on a number of gigs to drive a Yamaha MU-10 MIDI module, basically to provide backing tracks for an occasional electro-acoustic duo act I did with cellist Saskia Tomkins.

However, MIDI is a far more compact way of representing music than a digital audio wave file, which uses up 10.5MB per stereo minute. Given that my steam-powered portable PC never had more than about 100MB of disk space going spare, this would

⬇ **A multitrack recording system based around a Compaq Presario notebook, a FireWire interface box and a Mackie CR-1604 mixer.**

⬆ **The front and back panels of the Nuendo Multiset show the wealth of connection options available.**

have allowed the grand total of ten minutes total WAV recording capacity.

Now, I have a powerful PC with over 3GB of available hard disk space, and that's after all the music applications have been installed. You might think I've got the core of a nice little portable multitrack recording system, but sadly it isn't as simple as that.

Expand the mind

One of the great advantages of a normal desktop or tower PC is that it's easily expandable. Simply drop a specialised PCI interface card into one of its internal slots and you can convert your mundane business PC into anything you fancy. In my (or rather my PC's) case, I've rehabilitated a number of older machines this way to perform useful tasks in the studio.

However, as you'll know, when it comes to portable PCs this useful expandability isn't nearly as easily available due to the physical constraints of the packaging. This means you have far fewer options when it comes to using a portable PC for anything other than normal business applications.

A fundamental problem is that the audio hardware fitted in most portables is usually pretty dire – typically a basic chipset integrated onto the motherboard. The connection options are also limited, because connector space is at a premium on the

cramped rear panel of your average notebook PC. For instance, my Presario 1200 only has a microphone input and a headphone output. The upshot is that you will need to buy some dedicated audio hardware add-ons if you want to approach anything near serious music-making on your notebook.

Unlike with a desktop PC, you won't have access to the large number of reasonably priced PCI audio interfaces that have become available over the years. It's a real shame because the PCI bus is ideal for high-performance audio, as it can handle very high data rates. These cards are just too large to fit inside the confined spaces of a notebook interior. All is not lost, though – there are options available that plug into PCMCIA/CardBus slots (these days called PC card for added confusion), USB and FireWire ports. Both PC card/CardBus and USB ports are pretty common on notebooks, with FireWire increasing in popularity recently, especially on more expensive systems (and Apple iBooks).

I'd rule out USB for audio. While the data throughput of the USB bus in its fast mode (12Mb/s) is high enough to handle multichannel audio, both the latency and the fact that the audio device has to compete with other USB devices for bandwidth mean that it would be difficult to ensure good

➤ The CardBus interface provides a way to connect your portable PC to the real world.

results using this type of interface. 'Latency' in this context refers to the interval between the time some realtime event actually occurs – in this case, the sound you're trying to record – and when the computer detects that event. With audio data, delays much above 5ms are noticeable and can seriously affect the usability of the system.

Using a CardBus interface looks far more promising, since it has a much more direct route to the underlying PC hardware. CardBus is a 32-bit data bus, which is a

development from the 16-bit PCMCIA interface standard. PCMCIA stood for Personal Computer Memory Card International Association and was originally designed as a convenient way to add memory to portable computing devices. However, it didn't take long for developers to realise that it could be used for more general interfacing tasks. When the specification was upgraded to 32-bit, CardBus' designers took this interest into account and enabled it to handle data rates up to 132MB/s and offer similar facilities to the standard PCI bus.

The final option is the FireWire interface. The latest version can handle data transfer rates up to a maximum of 400MB/s while still retaining the ease of connection that you get with a USB system. The standard was originally developed by Apple, but has been taken up by other manufacturers such as Sony (which calls it i.LINK) for transferring digital video between systems, and it has been adopted by the IEEE.

Once this interface becomes almost universal, there should be a big market in

interfaces that will bring down the price of peripherals considerably. To take advantage of the higher data rates, your notebook PC needs to have FireWire integrated into the motherboard.

Nuendo Multiset interface

I've been using Steinberg's Audiolink 96 Multiset interface, designed to augment the firm's Nuendo integrated multimedia production environment, which has a CardBus interface. This hardware is basically a rebadged RME product and can be used with any software that works with either Windows or Steinberg's ASIO interface standards. In terms of physical connections, the unit provides eight analog audio inputs and outputs – balanced or unbalanced – along with an additional eight inputs/outputs via ADAT Optical Links, plus S/PDIF, word clock, ADAT synchronisation and MIDI-in and out connectors.

If you want to delve a little deeper, the Multiset is equipped with 24-bit converters, with sample rates up to 96kHz – it's bang up to date with regard to audio quality. The whole package fits inside a small but robust box (45 x 215 x 120mm), which is essentially a half-width, 1U rack unit. It has a number of power supply options, with an external mains power supply plus cables for connecting the unit to a car cigarette lighter or 12V rechargeable battery. RME says that it thought of powering the unit via the CardBus interface but that its power requirements were beyond the interface specification. To be honest, this isn't the sort of device that you'd operate in environments without some form of auxiliary power being available.

The Multiset connects to the Nuendo CardBus interface via a high-speed serial cable, which turns out to be FireWire compatible. This means that if my portable gets fried by lightning again, I'll be able to plug the interface directly into the replacement PC, as FireWire should be fitted as standard by that time.

It also raises the interesting prospect of equipping a studio PC with the PCI Audiolink 96 interface so you could share this module between studio and location recording tasks.

System configuration

Multiset's eight line-level inputs and outputs are accessible via 1/4in jack plugs, which ►

BACK TO BASICS: BALANCED/UNBALANCED SIGNALS

If you take apart your average guitar or keyboard audio connector, you'll find a single conductor and a braided or twisted shield wire. If you dissect your hi-fi's cables, you'll see these are the same. However, if you disassemble a microphone three-pin XLR connector, you'll find two conductors and a shield. So why the difference?

In short, guitars, keyboards and sound systems usually employ 'unbalanced' cables, while microphones usually use a 'balanced' connection scheme. Microphones generate a much lower signal level than those other types of equipment and thus are more prone to picking up interference from radio transmissions (RFI) or from the magnetic fields associated with power cables (hum). This problem is caused by the fact that you need to have much higher gain (that is, amplification) on a microphone channel to get a decent signal level, but this bigger gain will also bring up any unwanted signals –

such as AM radio or a passing taxi.

The solution to the problem is to have two parallel conductors that carry the electrical signal in antiphase. The preamps at the receiving end of the signal effectively invert one of these two signals to reconstitute the original waveform, as you'd expect to see in a WAV editor. This inversion also gets applied to any interference on the antiphase signal wire, so that it now cancels itself out since the noise signal is identical on both wires. Is that simple or what?

In live situations, the line-level signals – which operate at much higher levels – don't use this scheme (so are unbalanced). However, in the studio where the electric noise pickup has to be kept to a minimum, often the line-level signals also use balanced cables to ensure the highest possible quality in spite of the additional cost of cables, connectors and patchbays.

⌚ Cool Edit Pro provides a simple 'what you see is what you get' interface.

⌚ Cubase SX needed more power than the Compaq could provide.

can be used in either balanced or unbalanced mode – its audio circuitry automatically detects the type of connection and compensates accordingly. Having only line-level inputs and outputs means you'll have to use the interface with a mixing desk of some kind, especially if you need equalisation or level-control features.

I could quite easily dedicate this whole column to the various options for going about and doing this, but to be brief, unless you have a mixing desk designed for multitrack recording, the easiest option is to use either the direct channel outputs or the channel insert points to tap into the individual audio signals before they get mixed down to stereo.

On the Mackie CR-1604 mixing desk I use for live work, I can simply use the

insert points on the first eight channels to do this.

Obviously, the thing to remember is that the quality of the mixer will have a major impact on the quality of the recorded sound, however, as long as the desk is electrically quiet, you should be able to get good results.

The Mackie CR-1604 – for all its other shortcomings – gives a very 'clean' sound, which makes it a good choice for this kind of application. The Multiset also provides a good set of interface-level options on internal jumpers, allowing you to match its input and output signal levels with the mixer.

Software issues

To be able to use this kind of

hardware, your audio application needs to have two important features. The first is that it should be able to playback audio in some kind of multitrack mode. This is equivalent to the 'arrange' window common in sequencers like Cakewalk or Cubase and allows you to display and record the new audio alongside existing tracks. The other requirement is that the software has to be able to simultaneously record multiple tracks, which should be true of all but the most basic of audio packages.

Although the Multiset is obviously packaged to augment Steinberg's Nuendo software, there's nothing to stop you using the device with any software that can recognise and use multiple audio inputs. As I don't have a copy of Nuendo, I've been

using the Multiset with Cool Edit Pro in its multitrack mode, and I also had a brief excursion into using it with Cubase SX. Despite it being an older version of the software, I found that Cool Edit Pro worked well, giving an intuitive recording session feel, simply by selecting the desired input channels and then putting them into record mode.

Cubase SX was also simple to set up, but it obviously needs a more highly specified PC than I have, since it wouldn't reliably record four simultaneous tracks without losing data. This difference in performance may be related to the fact that Cool Edit was originally written for the PC, whereas Cubase has been ported from the Apple Mac. I plan to see how SAWStudio and Cakewalk's Sonar behave, as they're both dedicated PC packages.

Tips & tricks

One useful trick when using a digital delay in a mix-down session is to select a delay time that's related to the tempo of the track that you're recording. This technique can add 'punch' to the track and prevents the delay from making the mix muddy. This is because it tends to reinforce the rhythmic elements rather than competing with them. While it's not a particularly onerous task to calculate the required delay, I've just come across a little freeware utility called Delay Calculator on the Steinberg support Website.

Written by Ian Price, this useful little program lets you enter the tempo, the note type (crotchet, quaver, minim and so on) and then displays the time delay that this implies. You can even select a triplet time. The entire program has a file size of just 340KB and so won't take long to download, even if you're using a modem. Just pop it on your desktop and fire it up whenever you need to work out a delay.

You can download the application from the Steinberg FTP Server at ftp://ftp.steinberg.net/download/pc/dtc/DELAYC_1.EXE

EMAIL MARKETING OR SPAM TACTICS?

Jane Dudman and David Hallaby reveal the factors threatening the potential of email marketing.

In an online environment growing more hostile to spam each day, the advocates of email as a marketing tool have to tread a fine line. Initial enthusiasm about the benefits of email marketing has started to shift towards a more realistic assessment of this addition to a marketing team's armoury. At the same time, consumers are growing increasingly irate about what they see as annoying intrusions into their inboxes, and they're being supported by legislators in the US, UK and Europe, and now Australia.

Given this backdrop, it's increasingly important to get the facts and figures about email marketing right. You must ensure your marketing team knows exactly what it can and can't achieve as part of an overall marketing plan. That way, you may be able to avoid some of the obvious pitfalls along the way.

The advantages of email marketing are considerable. It's cheap to produce and deliver, although true cost-effectiveness has to be carefully assessed. It also has a huge potential reach, and it can be personalised to get certain marketing messages over to specific groups of potential buyers.

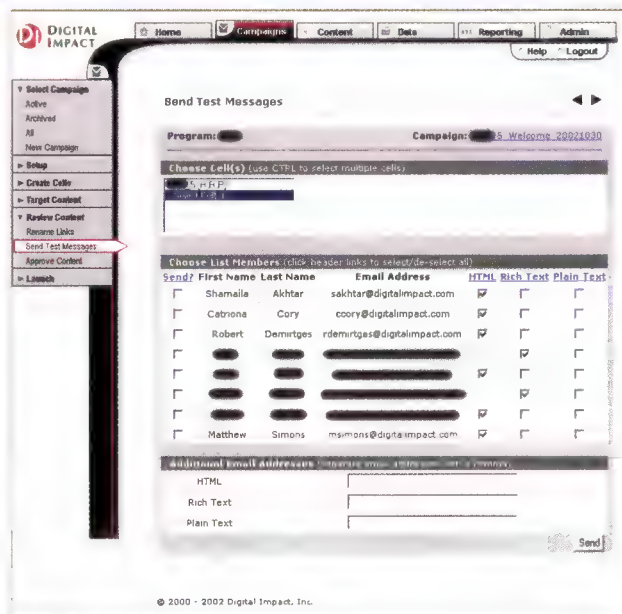

However, there are many downsides. It's crucial with email marketing to consider the desired end result. Often, emails are used to drive potential consumers to a Website, but the reason for this may not be to get them to buy products or services online; sometimes it's enough just to push up site traffic. Whatever the aim, it has to be clearly defined and the end result carefully measured, otherwise email marketing really is skirting close to spam.

One of the big debates is whether consumers should be able to opt out of email marketing or have to opt in by giving explicit permission. In Australia the National Privacy Principles defined in the Privacy Act have been interpreted as requiring consumers to 'opt in'. Although the principles have yet to be tested in court, the CAUBE (Coalition Against Bulk Unsolicited Email) says that, in simple terms, the principles state that if you collect information from a person, and it is reasonable for you to ask permission to use personal

information for marketing at the time of collection, then you may not use that information for marketing unless you have obtained permission. Most notably, a vendor who spams email addresses collected via a Web page and did not ask for permission on that Web page will be in violation of the new law, even if they offer an 'opt-out' option in the spams. According to CAUBE, 'While you may be tempted to think this interpretation of the new law is a radical one, the Privacy Commissioner has given the same interpretation.' Soon, new EU laws could make opting in the only legal option in Europe, a decision which would be welcomed by anti-spam groups such as EuroCAUCE. It estimates that if only one percent of the EU's 18.4 million businesses decided to operate opt-out email marketing, you could employ somebody full-time for a whole year doing nothing else but issuing remove requests.

International concerns have grown so high that guidelines on how to use email marketing efficiently without abusing the email system have become freely available. CAUBE (www.caube.org.au/business), which has worked with several Australian government organisations in helping formulate laws and regulations covering spam, provides comprehensive information for businesses wanting to direct market over the Internet.

It's not just getting branded as a spammer that concerns those wanting to use email marketing effectively. Email marketing may seem easy, but it's still at an early stage of development compared with the many years that have been put into direct marketing by

The appropriate format can be chosen for email clients, in this case for HP's online campaign.

conventional mail, and several aspects need fine-tuning.

Getting email marketing right is a complex combination of technology, marketing, keeping on the right side of the law and, above all, gaining the right kinds of responses you want from customers.

Everybody's doing it

The perceived cheapness of email marketing is certainly a major attraction.

Companies of all sizes love the idea of being able to get out a message quickly and cheaply to potential consumers, or to their trading partners and suppliers.

Small companies have been particularly quick to take advantage. According to a recent report by the Direct Marketing Association on the use of email in the US, smaller companies allocate the highest percentage of their marketing budget, 21.4%, to email marketing, compared with large US companies, which spend 13.7% of their total marketing budget

on email.

The figures being bandied about seem to bear out the cost-effective nature of email marketing. In the US, HP has been running an email-based campaign for its printer buyers for some time. It claims this is mainly because it was costing too much to support customers via telephone calls into its support centre. An email costs between three cents and eight cents, whereas a phone call can cost up to US\$15 (\$24.20), according to HP, which estimates it's saving US\$150,000 (\$241,936) every month in shifting support calls over to product support emails. Again using US figures, HP also claims direct mail costs US\$163 (\$263) per lead and email costs just US\$7 (\$11.30) per lead. That makes email 27 times more effective than direct mail, for HP at least.

But not everyone is getting carried away. Monica Horten, Director at B2B marketing specialist Pragmetix (www.pragnetix.com), cautions that when all the real costs of email marketing are taken into account, a different picture can emerge. There's a lot of upfront investment in setting up an email marketing campaign. Firms have to get their databases in

order and sometimes that can be a showstopper, because they don't realise they have all this upfront work before they can do anything. It's still not as expensive as direct mail, but it's more than companies expect. It's not free.

Avoiding the taint of spam is a major challenge and the legal framework in Australia is being tightened. While the Privacy Act requires organisations to adopt a code of practice embracing 10 national privacy principles as to how personal information is gathered and used, the National Office of the Information Economy (NOIE) has recommended specific legislation banning the sending of commercial email without prior consent unless there is an existing customer-business relationship.

The Federal Government has announced plans to adopt NOIE's recommendations, contained in its recently released national report on spam and go ahead with the legislation – a move opposed by the Australian Direct Marketing Association, which says legislation won't work because so much spam is sourced from overseas.

THE LEGAL FRAMEWORK

The main law in relation to email marketing is the Privacy Act 1988, which imposes general requirements on companies about how they collect and use personal information. The key principle is that any personal information must be used only for the purpose for which it was collected and that all companies with an annual turnover of \$3 million or more must adopt a code of practice that incorporates the 10 national privacy principles (see www.oaic.gov.au) set down in the Act.

The Privacy Act's coverage of email is yet to be tested in court. While both the Privacy Commissioner and CADE believe that it entrenches a compulsory opt-in situation in respect of commercial email unless there is a specific established customer-business relationship, the NOIE is more cautious. It says it has yet to be tested if an email address is considered personal information.

The Trade Practices Act 1974 is an effective tool against commercial email practices that mislead, deceive, mislead or provide false information.

Unlawful programs, links to misleading websites and spoofing of the originating email addresses. It has been used on numerous occasions by the Australian Competition and Consumer Commission to bring down the business of individuals who were selling goods for nefarious purposes.

In some cases the Criminal Code Act 1995 could be used against those who which transmits financial volatility.

In future the Federal Government has indicated it will introduce legislation based on the NOIE's recommendations. That includes a compulsory 'opt in' model where there is no existing customer-business relationship. It would also require all commercial email to contain accurate details of the sender's name, physical and electronic addresses and require ISPs to make spam filtering options and protocols available to their customers.

The NOIE also wants to see the creation of a new offence of using a carriage service to commit any Commonwealth offence and a review of the Privacy Act to ensure that it properly covers telemarketing.

One of the weekly email newsletters sent out by First Direct in conjunction with The Motley Fool.

But just as important is the problem of email marketing being perceived, if not quite as spam, then certainly as an irritant. This is something of which all reputable email marketing people are aware. It doesn't deter them, but they are careful to emphasise the framework within which they work. The ADMA's Code of Practice makes it compulsory for its members to allow recipients of marketing material to 'opt out'. However, according to the CAUBE the most important aspect is to ensure consumers have given their permission to receive unsolicited marketing material by email – that is, they must have opted in.

Those who wish to avoid spam could use the Direct Marketing Association's (DMA) voluntary scheme called the eMail Preference Service. For an annual fee, businesses get their email mailing lists cleaned up against the DMA's central database of people who've said they don't want to receive marketing material by email. Australian consumers can add their details to this international database (www.dmaconsumers.org/consumers/optoutform_emps.shtml) to opt out of receiving commercial emails from any DMA members worldwide. It is compulsory for Australian DMA members to remove any names on the database from their e-mailing lists. The main problem with this approach, though, is that it's only used by those

Model
OPTI COMBO DRIVE 4 IN 1
Now you get more performance,
speed and versatility

Optimised power protection and data back-up that gives you the confidence to do what you do best.

Compare OPTI's great range of UPS (uninterrupted power supply) and Storage Drives, and you will see the added quality and product benefits over other leading brands.

Don't risk losing valuable data or damaging your hardware with the compact OPTI 500VSII UPS. Ideal protection for personal computers, SOHO and workstations.

OPTI 500VSII UPS BENEFITS

More time to
back-up your
valuable data

2 year on-site
pick-up warranty

User replaceable
battery – even
when the UPS
is running

Protects your
computer against
lightning, surge
and EMI/RFI

OPTI-SAFE+ Software – bundled with every OPTI UPS

- Support multi-OS including Novell Network, NT, Windows 95/98/2000/ME/XP, DOS, OS/2
- Auto/scheduled save files and shutdown
- Notification of power events for network safety

Safeguard and back-up with confidence using the OPTI Combo Drive 4 in 1. Ideal to read, write and re-write CD-ROM, or read DVD-ROM – not to mention watching your favourite movies.

OPTI Australia
Confidence & Performance

'Part of the puzzle was identifying a target group when we were sending out the email promotions,' explains John Woods, Chief Executive at Site Intelligence. 'We needed a third-party list because there weren't enough contacts in our own database, but we wanted

As well as lowering response rates, buying third-party lists can be expensive. 'Cheap is a relative term,' points out Andrew Davies, head

⬆ A sample email showing the MessageLabs branding, which a company can substitute for its own branding.

of e-marketing at online and telephone bank, First Direct, 'Email marketing is cheaper than direct mail, but if we're buying a list of non-customers, we have to buy big lists and that's where the cost-effectiveness can be challenged.'

Like other companies, First Direct has found considerable differences in the response rates to its email campaigns. When the bank launched an independent financial advice arm, it had an integrated campaign that included an email shot in conjunction with online investment firm The Motley Fool. 'Over the first six months, 50,000 people signed up for our weekly newsletter, which we've now been sending out for about 18 months,' says Davies. 'We believe the real success has been the success of both brands. If it were just First Direct, I think people would wonder how much a bank could tell its customers.'

The weekly email newsletter has open rates of up to 65% and click-through rates of about 25%. 'The more creative we've been, the better the response,' says Davies. One lesson learned by First Direct is that customers buy more from a Website than in direct response to email, so the bank's email shots now mainly focus on driving customers across to its Website.

Finding out what works and what doesn't in an email marketing campaign is still something of a new art, but lessons are emerging. 'It's an evolving environment,' says Site Intelligence's Woods. 'We've experimented with varying trivial things, most obviously the subject line, and that can cause a variation of up to a factor of ten in response, even if the content is identical.'

One example is the promotional email

HOW NOT TO DO IT

Manuscript identified as being for an interpretation of the Privacy Act in relation to Vol 1000, dated 14-2002. The document is signed by one of its authors.

There have been a few other high-profile cases where companies have been embarrassed with members that the company's membership page says they're not. In the case of a Social 100 member, it just said not to go around freely providing inside plans to others. The allegation was that Sarnbury's wife, a listed exec, had given a competitor's executives the inside scoop on what the company was planning to do. It's unclear whether this was a result of the allegation.

There have been problems in the U.S. in carrying out two counts mandated by the 1994 Clinton-Satterly agreement: a national gun buyback program and a gun buyback pilot program in Washington state. The Clinton gun buyback credit with matching state funds is \$100 million. President Bush has said "URGENT Action Needed" and demanding a full gun buyback program be "immediately" implemented by President Bush.

'We tried both, because we didn't know which would work,' says Woods. 'We had twice the response rate from the Website performance subject line as we did to executive briefing. There's no single right answer. Firms have to find out which way to best use the limited real estate involved in email.'

Formatting is another big factor. The designers of promotional emails swear by HTML rather than just text, not only because of the design aspect but because it allows closer tracking of whether the emails have been read. But to be viewed as they're intended, HTML formats need to be readable by the email client. 'The programs we're developing can tell whether an email client accepts HTML and can automatically send the right format,' comments Dean at 1000heads. But there's one exception

Monitoring response rates to emails has become increasingly sophisticated over the past couple of years. 'We can now track so much more,' says Dean. The main tools for tracking replies and click-throughs include creating a specific

It's one thing to monitor responses, including bounce backs and unsubscribe requests, but some companies need more definite proof of response rates. In Australia the Circulation Audit Board, a sister organisation to the Audited Bureau of Circulation, which audits newspaper and magazine circulations, now offers a third party verification of Website traffic data. The CAB report verifies the volume of page impressions sent from the Website over a defined time period. All reported data is measured using the Australian approved standard definitions and does not contain activity generated by robots, frame activity or unrequested pages. It also reports unique hosts, users, visits, sessions and others.

The CAB and the ABC have been working with media industry bodies such as the

Australian Association of National Advertisers, Advertising Federation of Australia, Australian Direct Marketing Association, Internet Industry Association, Media Federation of Australia, major Web publishers, measurement

SRS® surround sound technology allows you to enjoy high quality stereo sound usually offered by high-end audio appliances.

BenQ

Enjoyment Matters

companies and others to develop a set of Australian industry accepted standard measurement definitions based on the standard definitions already used in more than 30 countries.

CAB also offers an email audit that verifies the total average net delivery of emails per issue sent over a defined period. The audit verifies and reports the average number of emails sent, less any excluded distribution such as failed addresses and enables publishers to show the volume/percentage of requested or subscription only copies delivered, as well as full demographic profiling where information can be verified.

As well as certification, there's a growing demand for branding. MessageLabs (www.messagelabs.com) has developed a 'watermark' system to allow firms to brand their emails with company images and logos. 'At the moment, companies are sending out thousands of emails completely unbranded,' says Mark Sumner, Chief Technology Officer at

MessageLabs. According to Sumner 'They wouldn't dream of sending out company letters on plain paper. We think this will be a huge market.'

Woods at Site Intelligence emphasises that flexibility needs to be built in.

His company sent out promotional emails about a series of seminars, the date of one of which had to be changed because of a public scheduled transport strike. 'We were able, at short notice, to re-mail everyone,' he comments. 'That was important, as we didn't necessarily have everyone's phone number. It's not difficult, but it's important to have flexibility.' Inflexibility is particularly noticeable among some of the larger firms now getting online and using email.

British Airways, for instance, is unable to cope with responses to its ticket confirmation emails (see *How not to do it*).

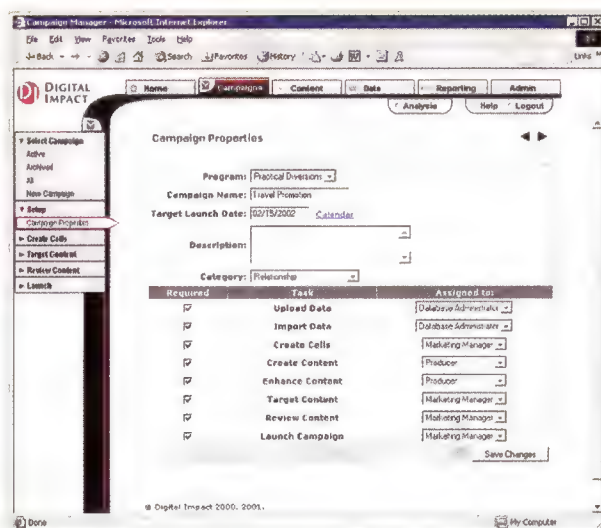

Other companies use email-filtering systems to ensure that when they send out mass emails only genuine queries get back. Digital Impact is one such company that filters email responses. 'We have a sophisticated database that sweeps an email and looks for keywords,' explains Nick McConnell, of Digital Impact.

The company filters up to 95% of all email responses, including unsubscribe requests, and forwards on the remaining 5% to its client.

'By screening out the garbage, it allows our customers to respond to genuine emails more quickly,' says McConnell. 'It's an important aspect of email marketing, because people expect email to be a two-way dialogue.'

The disclaimer

There are lots of ways in which email marketing has the potential to foul up. If a golf shoe firm rents a list of 200,000 names for an email shot and only 1,000 of those people are interested in golf shoes, it's succeeded in irking 190,000 people, points out Jeff Barnes, from email marketing specialist Bluestreak, which has been running a big email-based campaign for Reebok.

⤴ A sample email showing the MessageLabs branding, which a company can substitute for its own branding.

HOW WE RATE AS SPAMMERS

Much of the opposition to Australia's proposed anti-spam legislation is based on the claim that most spam originates from overseas and is therefore not covered by Australian law. However, according to CAUBE Australia is a major contributor to the global spam problem.

A 1999/2000 survey by the Australian-based Coalition Against Unsolicited Bulk Email (CAUBE) estimated that Australia accounted for about 16% of all spam that is sent globally.

While CAUBE says this percentage may have decreased significantly in recent years as the volume of spam from other regions, such as Asia and Eastern Europe, has increased, the total volume emanating from Australia has not.

According to the NOIE's report Western Europe was not regarded by any Australian ISP as being the primary source of spam, possibly because of relatively strong European privacy laws which are currently being reinforced through the EU directive requiring a qualified opt-in for commercial email.

Barnes, perhaps not surprisingly, doesn't think the answer is to blame the medium, just as consumers don't blame the poor postman for junk mail.

'Take it up with the people who sent it,' he comments. 'They haven't researched their market properly or they haven't sent what the consumer asked for. But properly done, email marketing is a powerful tool.'

At the same time, the technology in use is getting smarter.

One thing we'll see more of is embedded Java executables within email messages, so animation can be used without creating huge overheads in the size of the email itself (such as those found when using animated images).

There will be more viral marketing, with messages passed on between users, either through incentives or because of the message content. To date, charities have been the main beneficiaries of viral marketing, because people appear not to mind passing on what they see as a worthwhile message.

It's a hard fact to ignore; the puzzle for the marketing people is how to turn that goodwill into a marketing tool for commercial products and services.

As email marketing continues to develop and spread, and businesses discover the advantages, it's hoped we'll see more carefully targeted email shots. Research firm Forrester forecasts that spending on email marketing will reach US\$6.8 billion (\$10.97 billion) by 2006.

One thing's for sure: email marketing is here to stay.

**Subscribe now and receive Trainz Railroad Simulator
FREE, worth \$69.95.**

Trainz Railroad Simulator is the most detailed and immersive railroad experience, letting you control almost every aspect of a working railroad. Let your imagination run free as you create stunning 3D worlds, take charge of thousands of tons of heavy freight or simply keep your passengers happy as you take on the challenges of a real train engineer. Add to the excitement by controlling multiple locomotives, coordinating activities, switching junctions and ensuring each train arrives safely at its destination.

Driver: a full driving simulation and much more

As engineer, climb into the full 3D cab, and take charge of passenger runs, shunting yard exercises and heavy freight movements. Choose from the simple or realistic controls, or simply sit back and admire the spectacular scenery. For a completely different perspective, switch on the autopilot and operate all the junctions as you ensure the safe and smooth running of your own private railroad.

Surveyor: an easy to use and addictive world editor

Move mountains, construct cities, create dense forests and lay your tracks, roads and power lines using this powerful and intuitive world editor. Add life to your creations by controlling the weather conditions, setting the lighting moods and adding animated industries. Choose from the 1000's of objects included, download new free custom content or create your own.

My Collection: engine shed showcase

Examine the stunningly detailed and extensive collection of different locos, passenger cars, freight wagons, tank cars and cabooses! Discover the background and detailed statistics for each car or loco and operate the horn, headlights or pantographs. You can also check out all your downloaded custom content including steam locos, traction engines and more.

QUESTIONS & ANSWERS

David Moss contemplates hibernation after resolving a few PDF woes. But first, some questions.

HIBERNATION

Q My laptop doesn't seem to have a hibernation mode. Can I enable this, and is it safe to do so on a FAT32 disk? I'm running Windows XP. **K Remm**

A Under Windows XP, support for the hibernation mode is fully built into the operating system. In the past, it was supported by a combination of the hardware of the machine and the BIOS, you usually had to have a hibernation partition set up on the hard disk.

With Windows XP, just go to Control Panel | Power Options. Go to the Hibernation tab and make sure it's enabled, then go to the Advanced tab and decide what actions will take place when you either close the lid, press the power button or the sleep button. You may or may not have all three of these combo boxes, depending on your laptop's design. On each one you can choose from 'Ask me what to do', 'Standby', 'Hibernate' or 'Shutdown'. The Hibernate option only appears if you've enabled Hibernate in the Hibernation tab.

As for the disk formats supported, you have no worries, as Windows XP supports hibernation to FAT32 and NTFS, so it doesn't matter which one you have.

TINY FEET

Q A while back, I clicked on something when I was in Task Manager and now the menu at the top has disappeared. When I want to exit, I now have to press Esc. What should I do? **A Singh**

A You double clicked in the blank space to the right of the tabs, which switches Task Manager to Tiny Footprint mode. To reverse the process, simply

⤴ Here's Task Manager running in Tiny Footprint mode.

double click on what is now the top border of the window. Alternatively, go to Start | Run, type taskmgr.exe in the Edit window and see how much fun you can have trying to select <Ctrl+Alt+Shift> before hitting the Enter key. That will run Task Manager and restore it to its former glory.

EMBEDDED PDF?

Q Is it possible to embed a PDF file in a Webpage for display? **K Inners**

⤴ View Adobe PDF files with Acrobat Reader embedded in Internet Explorer.

A Not as far as I know. You'll have to create a link to the file on the Webpage and, when people click on it, the page will be loaded into Internet Explorer hosting Adobe Acrobat Reader.

This, of course, won't happen if a user clicks on the link doesn't have Reader installed, so it's good practice to create a link to Adobe's site from your page so that people can go there and download the program if required. You'll find small buttons on this page that link to all Adobe downloads: www.adobe.com/support/downloads/main.html.

Grab the Reader button and place it somewhere on your Webpage, linking it to the same page as Adobe uses, and people will easily be able to get Reader if they need it.

The URL that Adobe was using as the link from the button at the time of writing was www.adobe.com/products/acrobat/readstep.html.

MP3 ANXIETY

Q Is it legal to download and play MP3 files on my system? **I Masters**

A The simple answer is, yes. There's no problem with doing so, as long as those MP3 files have been placed there by, or with the permission of, their legal owners. Thus, downloading MP3 files from, say, an artist's official Website where they've made the files available for free download isn't a problem.

However, downloading music from a site that has simply ripped the tracks off a CD (or similar source) and made them available for download, and clearly has no intention of paying royalties to the artists, isn't legal — it's tantamount to receiving stolen property.

So make sure the source of the MP3s is legal before you start downloading music to your system or an MP3 player.

PDF INTO WORD

Q Is it possible to take data from an Adobe PDF file and place it into a Word document? Can the whole file be converted?

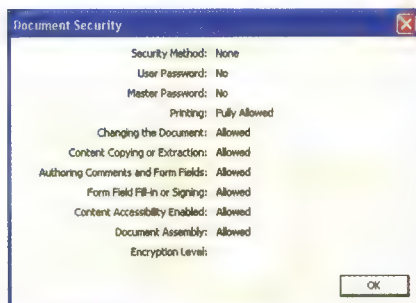

H Piel

A There may well be third-party applets that can do this, but Word doesn't convert Acrobat PDF files by default. Depending on the level of document security set by the author of the document, you might be able to copy text and capture graphics from a PDF document and paste them into Word.

To find out what the security settings are, go to the File menu in Acrobat Reader and select Document Security, or just press <Ctrl+Alt+S>.

The Document Security dialog will appear and you'll be able to see at a glance just what you can and can't do with the document you've loaded. Assuming you do have the permissions to do it, copy an entire PDF file into Word by heading to the View menu and ensuring Continuous is selected and then pressing <Ctrl+A>

⬇ The Document Security dialog will tell you what you can and can't do with Adobe PDF files while you have them loaded in Acrobat Reader.

(Select All). You can then use Copy and Paste to move all the selected items into Word. Be aware that this might not be a seamless transfer, as you may well lose formatting, fonts and so on, so what you eventually see in Word could look very different to what you saw in the PDF file when it was opened in Acrobat Reader.

READ ONLY?

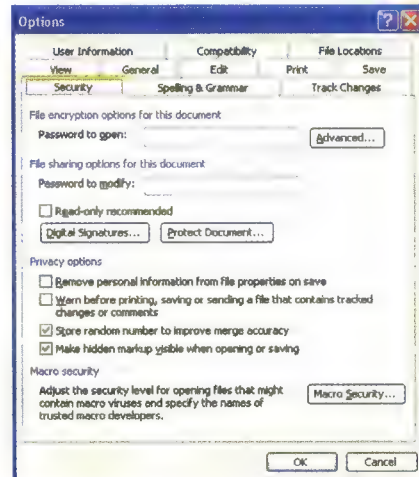

Q Is there a way of making a Word document read-only?

G Minn

A Yes, you can make a Word document carry a 'recommended read-only' tag, or you can make it completely read-only by setting a password and not supplying it to people who are going to receive the document.

In the former case, you enable the 'Read-only recommended' checkbox on the Security tab of the Word Options dialog, accessible via Tools | Options. Now, whenever a user opens

⬇ Use Word security to control who can do what to a Word document.

the document, they'll get a dialog suggesting it would be best to open the document in read-only format – any changes they make will then have to be saved under a different filename. Alternatively, by setting a password and not supplying it, the user will have to go for the read-only option on the Password dialog.

Another option you might like to consider is to place the documents in the Shared Documents folder on your system. The Shared Documents folder grants Full Control privilege to anyone with administrative privileges, but all others can only browse the Shared Documents folder (and any subfolders) and read the contents.

XP BOOT DISK

Q Could you explain how to create a bootable floppy disk for a Windows XP system?

M Klear

A I could, but I think you'd be better served by reading the excellent Microsoft Knowledge Base article (305595) on the subject, as it deals with how to create the disk and what to do if you encounter problems after creation. The article can be found at <http://support.microsoft.com/default.aspx?scid=kb;en-gb;305595>.

DIRECT CABLE

Q Why can't I use a COM port to make a connection to another Windows XP system? I'm trying to create a Direct Cable connection, and I was under the impression that this could be done in this manner.

Does it really have to be done using network cards?

T Milliner

BenQ

Perfect Vision.

Ultra-fast 16ms signal response time produces a smooth, flicker-free picture. And ultra-high brightness and contrast delivers sharpness beyond belief.

Enjoyment Matters

What do you want to be worth?

Skills count! When you are willing to invest in yourself others will invest in you!

Get trained and get going - it's that simple! Today's job market is competitive but for those who are willing to give themselves an edge - the ability to stand out in a crowd - there are some very substantial rewards. In a recent survey of Microsoft Certified IT professionals 61% felt their certification had increased their income and 16% felt it had increased it by over 25%, and average salaries for skilled knowledge workers continue to rise. In Sydney the average contract rate for all skills is \$62.70 per hour. Could you do with \$125,000 salary?

Isn't the IT industry doing it tough?

Yes it's true; some parts of the industry are doing it a bit tough. The dizzy days of the .com dot bombers have long gone. The good news is that the IT industry in Australia is still spending \$70 billion a year - that's billions - and you can get your share! How? By getting qualified, and then staying up to date.

In an industry where knowledge is power, you can get all the power you need!

LearnKey self paced training gives you access to the best of internationally recognised vendor certifications. We provide training for all the big name, in demand skill sets including internationally recognised certifications for Cisco, Microsoft, CompTIA, CIW, Lotus, Novell plus developer training for .Net,

"In most IT careers your most valuable asset is what you know...The more up-to-date and wider ranging your skillset, the more money you'll make!"

brainbox.com.au

SQL, Java, ASP, XML.XSLT, HTML and more.

LearnKey Best in the Industry

Self-paced training means you can study in your own time and at your own speed. No need to quit work and take up study full-time - you control the schedule. With LearnKey you get repeatable training, round the clock help from eSupport. Most LearnKey training programs consist of four components:

Training Guides - comprehensive industry-recognised reference/study books.

Interactive Training - an expert tutor leads you through a comprehensive overview of the

course. The program utilises simulated software exercises and challenges to ensure you fully understand each concept covered. Courses can be delivered via CD ROM, intranet or online - it's your choice!

MasterExams - simulated practice exams containing hundreds of questions that will assess your readiness to sit the real exam.

eSupport - access to your own personal online tutor. eSupport provides further resources and helps bridge the gap between 'theory' and the 'real world'.

So if you're serious about investing in your future there's no better way than LearnKey. We have

a course to meet your career needs that will fit your budget

Call us today! Discuss your individual training needs or find out how we can help your organisation.

InLearning
Invest. Involve. Inspire.

⬆ At the moment, you don't see a COM port connection.

⬆ and now you do. The default is that you don't, so creating a Direct Cable connection via COM ports requires you to do some Wizard work.

A You're correct, a Direct Cable connection can be set up using the COM ports, but first you're going to have to create a new connection. Open Control Panel, click on the Network and Internet Connection icon and then on Network Connections (go straight there if you're using Classic View). Look under the

Common Tasks pane on the left-hand side and select Create a New connection, click on Next and then select the 'Set up an advanced connection' option and click on Next. Select the 'Connect directly to another computer' option and, depending on whether you're the host or the client who wants to connect to a host, select the appropriate option on the next page.

The next page will provide you with a drop-down combo box and it's here you can select the COM port that you wish to employ. Complete the Wizard by choosing the users you want to be able to connect to the system and click on Finish. You have now created a connection that uses a COM port, so return to the Network Connections page and once again opt to create a new connection.

This time, select 'Accept incoming connections' instead of 'Connect directly to another computer' and you'll see that your new COM port connection option has been added to the default LPT connection option.

SLOW SHUTDOWN

Q Is there any way to change the amount of time Windows XP takes to shut down? I seem to get a lot of dialogs asking me if I want to shut down a running process now, or wait a while, when I try to shut down my system. A friend told me he'd seen systems where the timeout value

⬆ Modify the application timeout value for Windows XP if you're getting problems with apps at shutdown.

had been changed and that problem had gone away, but he didn't know how it had been done.

R Kastleman

A This is a registry job, so create a System Restore Point in case of problems. From Start | Help and Support Center, click on the 'Undo changes to your system with System Restore' link, select 'Create a restore point', hit the Next button and follow the instructions. With that out of the way, launch regedit from Start | Run and look for the following key:

HKEY_CURRENT_USER\Control Panel\Desktop.

You're now looking for the WaitToKillAppTimeout entry under Desktop. Double click on this entry to edit it and you'll see it's set to '20000' – this is 20 seconds expressed in milliseconds, and any change you make must also be in milliseconds. There's little point in making it too long, otherwise you'll be waiting even longer than you were before for the same dialogs to appear, assuming they were popping up because of problems on your system as opposed to sluggishness in the shutdown department.

My experience is that Windows Explorer is usually the culprit, and I generally tell it to try once and, if there's no joy, zap it ▶

BenQ

Perfect Features.

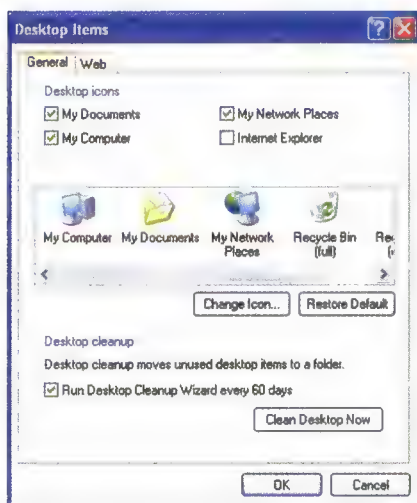

With a Digital Photo Frame and TV Tuner, it's much more than just another good looking LCD monitor.

www.BenQ.com.au

*optional extra

BenQ

Enjoyment Matters

⬆ How to prevent yet another pesky Wizard from running.

with the End Task button.

If you're seeing a lot of these dialogs and it isn't Windows Explorer at fault, you may have a problem that you're not going to solve by simply changing default timeout values. You'll need to be looking in a different (system configuration, loaded programs) area for a solution.

STOP MSC CONSOLE RESIZING AFTER CHANGES

If you're like me, you'll find yourself perusing the contents of the Windows XP Computer Management MSC console on a daily basis. And you might be just as frustrated as I used to be at its unwillingness to remain the size and shape to which you set it before closing it down. I can, however, offer you a fine solution to this problem. Right click on the Start button, select Explore and then navigate to the Windows\System32 folder. Locate the compmgmt.msc file, right click on it and select the Author menu item. The Computer Management MSC will load, and you can resize it as you desire. When you close it, you'll get a dialog box asking you if you want to save the console settings. Shout 'Yeeesss!', punch the air with delight and click on Yes. You may now act in a superior manner towards your fellow cubicle occupiers for the rest of the year.

KILL THE WIZARD!

Q Can I stop the Wizard that tells me I ought to clean up my Desktop and get rid of unused icons? It doesn't run that often, but I'm trying to reduce the number of pop-up windows that appear on my Desktop, as these can cause some games to crash.

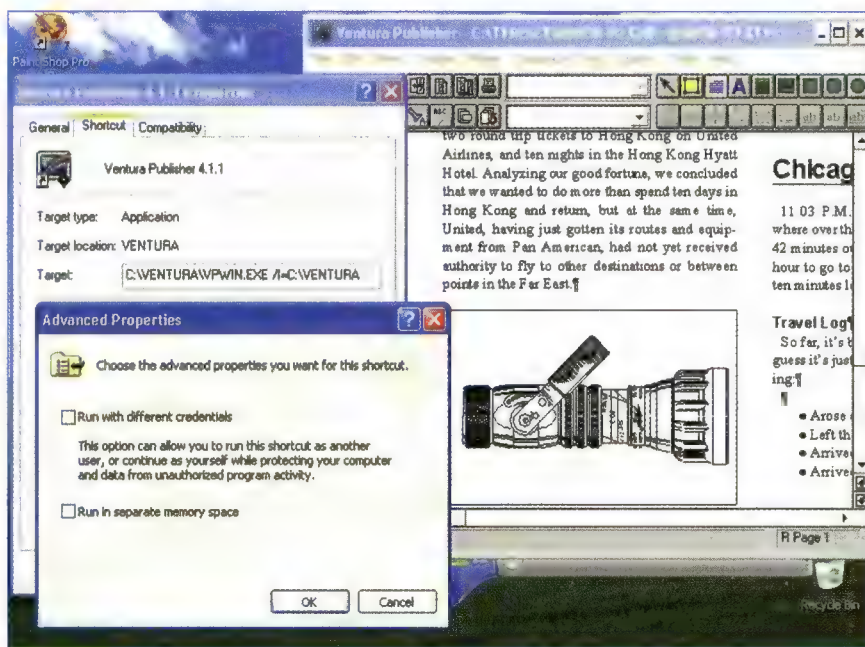

T Yamm

A This is an easy one, fortunately, and for once it doesn't require a trip to the registry. Right click on the Desktop, select Properties and then click on the Desktop tab when the Display Properties dialog opens.

Click on the Customize Desktop button and you'll see at the bottom of the General tab a checkbox labelled 'Run Desktop Cleanup Wizard every 60 days'. Uncheck it to prevent the Wizard from running. As you can see, there's a 'Clean Desktop Now' button there, so you can do this task manually whenever you wish.

The clean-up operation doesn't get rid of the icons, it simply takes them off the Desktop and stores them in a folder that you can access via a new Desktop shortcut, which it presumably won't try to hide (even if you never look in the folder via the icon it just created).

⬆ Many Windows 3.x applications will run quite happily under Windows XP. Here, Ventura Publisher 4.1.1 struts its stuff.

GOLDEN OLDIES

Q I have some programs I used to run in Windows 3.1 and Windows for Workgroups. Will they work in Windows XP? I haven't needed them until now, but they offer functionality I could do with using and I don't want to have to buy expensive modern equivalents if it isn't necessary.

R Gale

A Most Windows 3.x applications will run quite happily under Windows XP, but there are a couple of things worth keeping in mind. First, by default, Windows XP will run all 16-bit applications in the same virtual machine. If you're going to run more than one at a time, consider setting each one to run in its own memory space – otherwise when one crashes it will usually take the others with it. After installation, right click on the executable for the application and click on the Advanced button in the Shortcut tab. This will bring up the Advanced Properties dialog, and you can tell Windows to run it independently by enabling the checkbox labelled 'Run in separate memory space'.

Other issues that spring to mind with Windows 3.x applications are that they

won't understand long filenames, and I suggest you stick to running applications as opposed to low-level utilities that might have had a propensity to interact heavily with the Windows subsystems. If an application requires 16-bit device drivers, it won't work as far as I know, as Windows XP has no support for any sort of 16-bit device drivers. While we're on the subject of Windows 3.x, as a reminder for anyone who might have forgotten, Program Manager is alive and well even under Windows XP. Just do a Start | Run, type 'progman' and hit Enter to get back into a world of groups and group items.

LOST INFRARED

Q I've upgraded my system to XP and now find I can't transfer data using an infrared connection – something that worked just fine an hour ago. Infrared seems to be active, so what's

the problem?
M Frattle

A For infrared data transfer to take place between two devices, the Windows XP Workstation Service must be active.

This service is enabled by default if your system has a network adaptor, as it's a vitally important service for network connectivity. However, if your system doesn't have a network card, the service won't have been started. To start it and re-enable your infrared data transfer, do the following.

Click on Start | Run, type compmgmt.msc and hit Enter. Expand the Services and Applications tree, and click on its Services item.

Scroll down until you locate the Workstation Service, double click on the entry and make sure the Startup Type on the General tab of the Workstation Properties dialog is set to Automatic.

You should be able to start the service from the same tab.

After this is done, you'll find that your infrared data transfer attempts will be marked with the same degree of success that they used to enjoy. Hopefully, they'll stay that way.

ANNOYING DRIVER

Q Is there a way to avoid having to upgrade a printer driver on a number of workstations every time we get a new driver for the printer?

H Francis

A All you need do is install the driver locally using the method below:

1 Click your way to Start | Control Panel | Printers and Other Hardware | Printers and Faxes.

2 Opt to add a new printer, click on Next, select Local Printer, clear the checkbox labelled 'Automatically detect and install' and click on Next again to proceed.

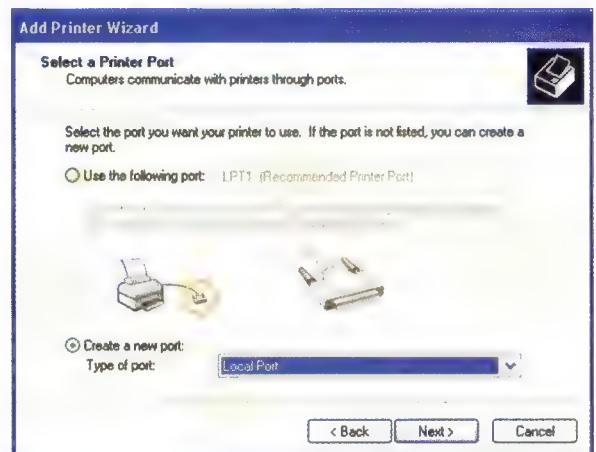

3 The Port Name dialog will now appear. Type the path to the printer in this format:

\\server\printer – substituting the name of the server and the name of the printer where appropriate.

4 Continue through with the rest of the Wizard, selecting a printer driver along the way, and eventually click on Finish.

Now, whenever the driver is updated on the server, it will be automatically updated on the workstations as well – saving you the trouble of doing the rounds.

↓ Set up a printer locally to ensure automatic driver upgrades from the server where the real printer can actually be found.

PING THAT PATH

How many times have you used ping and tracer to help you solve network problems? I'd just like to point out that under Windows XP you can use pathping instead, a command-line tool like the others that effectively combines both ping and tracer into one utility. After running a standard tracer, pathping then pings the routers it encountered on the tracer exercise for a period of time and returns you statistical data based on that. This is extremely handy when you are trying to track down a network problem, and are unsure which router, or routers, might be the source of the trouble.

DIGGING FOR DATA

The untimely destruction of your data doesn't necessarily mean that all is lost. **Ashton Mills** shows you how to bring it back from the dead.

Data recovery is a mystical and varied art that shares much with archaeology. Depending on where you dig for data you may or may not find what you are looking for, and the longer you leave going after your lost data the greater the chance it will be worn away by age and reduced to fragments of its former self.

Unlike archaeology, however, sifting through the desiccated bits of your hard drive's past can be easily done from the comfort of your study and with just a few simple tools.

But first it helps to understand the nature of data loss and the different levels of data recovery so you can choose the right tool for the job.

Your computer has been lying to you
When you delete a file on your hard drive the file itself isn't erased, only its *record* is.

If you read last month's piece on file systems (*issue 67, page 127*) you'll remember that all file systems use an index of some sort to store information about files and directories, including size and location on disk. This allows searching for the location of a file to be very quick, not to mention making the maintenance of even vast file systems a simple affair.

In the interests of performance it makes sense, then, that when a file is to be deleted all you really need to do is delete its entry from the index. To the end user, the file is no more. In reality, the magnetic bits and bytes that represent the file are still present on the disk, and can still be accessed and read.

The simplest form of data recovery, undeletion, involves scanning the filesystem's index, and sometimes the disk itself, for files and directories that still exist on the drive. Recovery is just a matter of re-creating an entry to refer to the space used by the file, although to be safe and keep the integrity of your file system most undelete programs will force you to copy

the file to a separate device or partition.

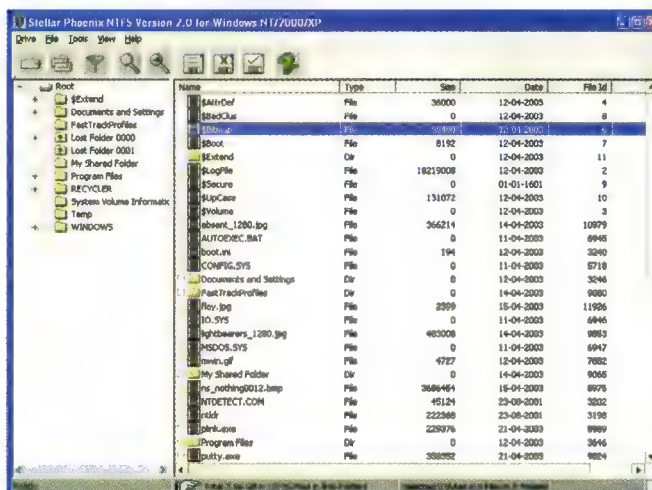

The effectiveness of this technique depends greatly on how much time has passed since a file was deleted and a recovery operation was initiated. With a file's entry in the index gone, it's free to be replaced by another.

Additionally, and more importantly, the disk space the file occupies is now free to be written over with new files.

Some programs are able to resurrect information about a file, but the data actually recovered from the disk may be partly incomplete and mixed with information from other files. The longer you leave it, the greater is the chance of this happening.

This is why the Windows Recycle Bin lets you allocate a set amount of disk space for file undeletion – it quite literally it backs the file up into the Recycle Bin, a complete copy, because this is the only guaranteed way to recover a deleted file regardless of how much the drive is in use. In reality, it never gets deleted, just *moved* to the Recycle Bin. And, in case you're wondering, when this happens the file itself is not moved from one location on disk to another, its entry in the index is merely changed to reflect a new location in the file system hierarchy.

Sometimes basic undeletion can't recover lost information, and more advanced forms of recovery are required. These can involve scanning drives for recognisable file headers (for example all Word docs identify themselves as such) irrespective of what the index says,

Recovering undeleted files can be a simple point and click affair.

undoing formatted partitions (again the success depends on if the drive has since been reused), reconstructing boot table entries, recovering data from bad sectors, and repairing incorrect partition information. Frankly, there's an awful lot that can go wrong in the fragile realm of magnetic storage, but thankfully the most any of us have to deal with is the loss of an accidentally deleted file. For this there are a range of tools available that support all the popular filesystems including, of course, FAT16/32, NTFS and even ext2/3 under Linux.

Software solutions

If you think you don't have a need for data recovery software keep in mind there are other causes of data loss aside from user error. Viruses can delete key files to disable a system, power outages could see your data only partly written to disk, and badly behaved programs could overwrite essential files. Additionally, data loss could come in the form of partition and boot sector damage. All of these losses, however, can be recovered with the right software.

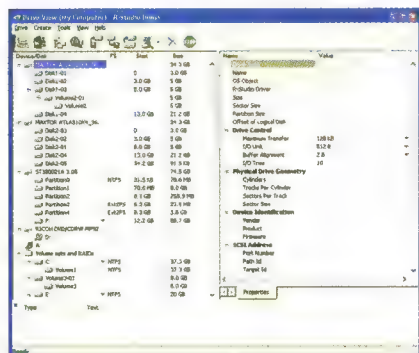

A Perfect mix of sophistication and intelligence from the most stylish LCD Monitor on the market.

Featuring a slim ultra-bright display, super fast 16ms response time, SRS® surround sound and the unique Digital Photo Frame - the BenQ FP591 and FP791 series delivers the perfect audio-visual experience.

BenQ

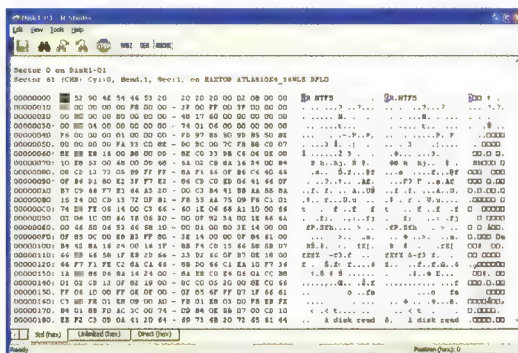

Enjoyment Matters

⬆ **R-Studio** is an example of an advanced recovery tool that can even build virtual arrays to help you recover data from multiple volumes.

Popular names include Zero Assumption Recovery, OnTrack Easy Data Recovery, and R-Tools R-Studio (see boxout *Recovery resources* for links). All of them can scan your partitions and present a list of deleted files you can select to recover with a simple click.

Additionally these also support the more advanced forms of recovery, such as scanning a drive for recognisable data types, and even the ability to search the disk surface bit by bit for a string of data you know to exist in somewhere in your

⬆ **Advanced recovery techniques** include being able to search the disk raw for parts of your lost data still intact.

file. Looking at the raw data of your hard disk, instead of through the filter of a file system and operating system, can be an excellent learning experience.

Keep in mind however that no software tool can recover the unrecoverable. If the sectors of your disk that contain the information you are after have been overwritten with new information, then the information is lost, kaput, sentenced to the void.

This is why it's vital to start recovery as soon as you realise you need it. Drive size, file system type, and how active the drive has been will all play a part on how effective recovery procedures are, but all of these are second to how quickly you get onto starting a recovery. It goes without saying that if you realise you've lost information and you go to install some recovery software, to not install it to the partition where the files you want to recover exist – you may well end up overwriting the sectors where the deleted files reside with your data recovery tool, and wouldn't that be ironic?

All in all, data recovery software is simple and effective to use, but doesn't cover the gamut of all data loss problems.

Hardware solutions

Sometimes the problem lies much deeper and software options become ineffective – such as a hardware failure or physical drive crash. A crashed drive generally refers to a drive whose heads have skimmed into the platters of the disk, causing irreparable damage. Old, overheated, and badly treated drives (and sometimes just bad luck) are the main causes for drive crashes.

But as with software recovery, the parts

of the platters still intact will hold the magnetic variances that represent your data. Thus, with the help of some special (and expensive) equipment, these platters can still be read and your data possibly recovered from them.

Data recovery services of this kind don't come cheap. At a minimum you'll be looking at a few hundred dollars (possibly exceeding the cost of the hard drive itself!) and this can easily scale much higher.

Obviously this is a last resort for those desperate situations

where the value of your lost data is higher than the money it will cost to retrieve it.

There are plenty of data recovery services in Australia (see boxout *Recovery resources*) who can recover data from all forms of magnetic and optical media (so information on CDs, DVDs etc can be recovered also).

Even RAID arrays can be partially reconstructed long enough to make images of their data.

Prevention

Ultimately, especially in the case of your personal data, prevention really is better than cure. Effective data recovery depends heavily on what, if any, preventative measures you take.

Use the Windows Recycle Bin. Many advanced users disable it to save disk space, but if you have plenty of space you might as well use it. You never know when it will save your skin. It does, however, only protect you from accidental deletions. For those unforeseen circumstances the best preventative measure is the much touted system backup. You do regularly back up your system, don't you?

If you've just been reminded, now is as good a time as any. Even if you don't do a full backup, at the least you should regularly backup information that is irreplaceable. Even simply copying the data to another partition, drive, or machine over the network ensures it resides in more than one location, and that alone may be all you need to recover lost data. For more advanced backup options, we'll be looking at backup in-depth in a future article.

RECOVERY RESOURCES

Data recovery is a big business and there are plenty of tools and services available to help you revive that essential lost data. The following is just a starting point – use Google to find more.

QUERYING EXCEL

David Hellaby shows you how to tailor your spreadsheets with Excel's little-known Web importer.

It's an accepted fact that most Microsoft Office users only ever use about 20 percent of the suite's capabilities, often because they don't have the time to learn about all of the goodies it contains. Excel, with its complicated interface and feature overload is notorious for baffling even experienced users. However, many of its features are very useful in their own right.

One of these features includes a built-in function to import data from selected sources. The Web Query tool, found in the past few versions of Excel, allows you to import data into a worksheet directly from the Internet or a corporate intranet. While XML and Web Services (coming in Office 2003) are likely to be the killer apps for importing and using data from external sources, Excel's Web Query is a functional, albeit rudimentary system.

The beauty of it is that you don't have to know how to write scripts or interpret HTML tags with the entire procedure requiring a few simple steps. Once imported the data can be dynamically updated so it's ideal for tracking share portfolios, fuel prices, interest rates and a host of other data that can make life a lot easier.

The disadvantage of using Web Queries is that a lot of data cannot be imported. For example, Excel will not import data from security enhanced sites such as bank Websites that don't use Windows NT security, so you cannot import your bank statement and dynamically update it. Nor will it import graphics or data from sites where scripts are used to generate or populate tables with data, even though it will display such data in the Web Query dialog box.

However, it can be used for importing a

range of single and multiple tables as well as formatted or plain text, and once the data is imported it can be analysed using Excel's basic features. For that reason it's best suited for corporate intranet use, but can also be used to monitor a wide range of data at home.

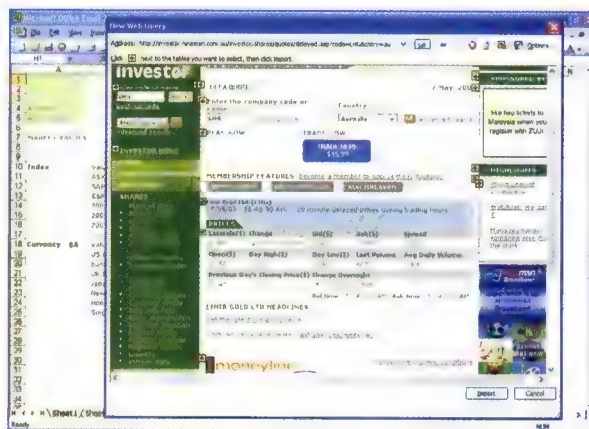

Microsoft offers a free add-on for Excel 2002 that provides refreshable stock quote data in a worksheet cell. The MSNStockQuote function allows you to calculate formulas based on the function's return values so you can create your own financial analysis. Once downloaded and installed from <http://office.microsoft.com/downloads/2002/Msnsg.aspx> it can be configured to return a company's stock price or other stock information, such as day's high, day's low, ask, bid, close price, and so on.

Alternatively you can create your own refreshable portfolio monitor in a single worksheet using imported data from multiple sites. For example, we created a worksheet that monitored multiple share indices, individual share prices and currency fluctuations, the cheapest place to find petrol, news headlines and the local weather. In other words, we created our own newspaper front page with specific, tailored information.

Find the source

There are three main methods of importing Web Query data into Excel: using the Import Data command; cutting and pasting using Smart Tags (in Office XP) or; exporting from Internet Explorer. We used all three as each has advantages in certain situations, but you do need IE 5.0 or higher.

You can also use the Edit command in Internet Explorer; however, it is better suited to intranet use or for Websites where you have control over the content.

➤ The Web Query dialog box indicates where there is potentially importable data.

We selected the sources of our data by trial and error because many of the sites we initially connected to made use of scripting so the data couldn't be imported.

To create a Web Query, open a new worksheet and click on the cell where you want to position the imported data. Next, head to Data | Import External Data | New Web Query. The New Web Query browser will – depending on your version of Excel – open at either the home page you have set in Internet Explorer or sample MSN page. You can navigate to the Website you want by typing in a new URL and clicking 'Go'.

Once you reach your selected site, you can navigate using its standard hyperlinks from within the Web Query browser. Elements of each Webpage appear with yellow and black arrow icons, which when clicked will turn blue, change to a tick and highlight the part of the Webpage containing the data you want to import. By clicking on the Options tab (top right of the Web Query browser) you can select whether you want the data imported without formatting (raw text or data), as rich text only or full HTML formatting.

The latter works best when importing XML (eXtensible Markup Language) data, but there's no guarantee that the rich text or full

KNOW...

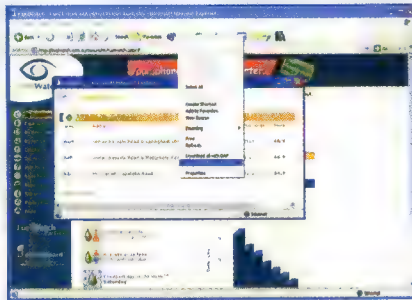

- How to import data from the Internet into Excel
- How to set up dynamically updated, multiple queries
- Where to get useful Web data
- How to use the Smart Tags in Office XP

① Tables can be imported as raw unformatted data (left), RTF or fully HTML formatted (right).

HTML will make any difference to how the data is imported, nor that the data will be imported at all – it depends on how the Webpage has been created and whether the data has been scripted or encrypted.

If all goes well you'll get a nicely formatted table complete with preserved hyperlinks. Even if you only get raw data, the good news is that it's still updatable. You can then place more Web Queries on a single worksheet by clicking on a vacant cell and repeating the procedure above.

Cutting and pasting from a Webpage into an Excel worksheet also works well. Highlight the text or data you want to cut and paste by holding down the left mouse button and dragging the cursor over it. Once highlighted,

② Data can be exported from Internet Explorer to an Excel worksheet

press <Ctrl+C> to copy it.

Open your worksheet and click on the cell where you want to position the data and press <Ctrl+V> to paste it. If you're using Office XP, before you do anything else look for the Smart Tag (a small clipboard icon) that will be at one corner of the material you have just pasted.

Click on the down arrow beside the Smart Tag to open a Paste Options menu and select Create Refreshable Web Query to open the Web Query Browser and import the data. If the data cannot be imported as a Web Query that option will not be available in the Smart Tag menu but you should still be able to paste it as static data.

Because exporting or editing from Internet Explorer automatically creates a new worksheet, it is best to begin a multiple Web Query work sheet with either one of them.

If you are searching for data on the Internet, exporting from IE to Excel has a slight advantage over importing from the worksheet because it is easier to search the Web from your native browser rather than the Web Query browser. IE also has an advantage in cases where you have to log in to a site to access the data you're after, because you may not be able to do so through the Web Query browser. However, its disadvantage is that it exports data as raw text compared to the Web Query browser which can be set to import in Rich Text Format or with full HTML formatting (if the site allows it).

To export from IE, right click on the table or text you want and select Export to Microsoft Excel in the drop down menu. A new worksheet will be opened, and by default the data will be positioned from cell A1.

If no data is downloaded and a box appears saying 'This Web query returned no data...' click OK. Now click on the name of the external data range in the top left of the worksheet, open the Data menu on the

toolbar, select Import External Data and click on Edit Query. It will open the Web Query browser at the page you have attempted to export data from with the arrows tabs indicating where you can potentially get the data you want. Select what you want then click on Import.

Web dynamics

One of the key benefits of Web Queries is being able to dynamically update the data over the Internet or intranet, and there are a few ways it can be done. It is worthwhile having a Refresh External data icon on your main toolbar. You can find it by opening the View menu, selecting Toolbars and checking External Data. This creates a floating mini toolbar that can be dragged to your main toolbar and locked there to keep it out of your way.

It contains several icons for editing, refreshing or setting the data range properties for a Web Query. To update data from a single Web Query click on a cell within the data range and click on the single red exclamation mark icon. A spinning globe will appear as the data is updated from the Net.

Where you have multiple Web Queries on a single worksheet, click on the icon with the green X and red exclamation mark. Again the spinning globe will appear, but this time all of the queries will be updated at the same time.

Queries can be automatically updated at set periods as long as you are connected to the Internet or your intranet, and where there are multiple queries they can be set to update at different intervals. To set the auto update, click within the data parameters, open the Data menu from the toolbar, select Import External Data, Data Range Properties. Check the 'Refresh every' box and set the number of minutes between every refresh.

It is best to enable the background refresh, so you are not interrupted while you work, and you can order it to refresh as soon as you open the worksheet.

Repeat the procedure for each Web Query and you will now have your own dynamically updated news sheets with the information you have selected. Furthermore, you now have all the grunt of Excel behind it so you can graph stock prices, run calculations, track finances and scan headlines all in the one screen.

It isn't a perfect option, but it's very useful, and it'll tide you over until Office 2003's Web Services really turn things up a notch in the coming months.

WHERE TO GO

Part of the challenge in setting up successful Web Queries is finding reliable, manageable sources. Check out these local data sources:

WARNING !!!

NEW

Is Someone at Home or Work Looking at Your Personal Files ?

It is a fact that 70% of inappropriate access to your files, with all the personal, legal, and financial implications occur at home or work.

What are YOU doing about it ?

The solution to this devastating problem is here. It is affordable, easy, and safe use.

HARDKEY is an innovative personal or corporate security system solution. This MS Windows compatible new product provides some of the most powerful data encryption available in the world today.

FINALLY A SAFE AND SIMPLE WAY TO CONTROL ACCESS TO YOUR COMPUTER !

HARDKEY has been designed for all PC users, small business, corporate and home use, with a powerful unique administrator function for a single or multi-user network.

WHAT IS HARDKEY?

HARDKEY is a small USB device, which fits onto your key ring. This device is tamper proof. Each separate key is uniquely controlled by your Administrator key software.

YOU CONTROL WHO SEES WHAT!

1. Easy to use.

Load the software, plug in the USB "key", select the file you wish, encryption is a mouse click away. Remove the HARDKEY and instantly your files become inaccessible

2. Lock out access to specific files, directories, the internet and peripherals.

3. Hundreds of Applications. HARDKEY is ideal for LAPTOPS, doctors, lawyers, Universities, research institutions, governments, military and law enforcement agencies, or simply to keep your files safe at home.

4. Multiple users.....up to 32 users per computer

5. Guaranteed Secure Data transfer...secure email attachments

6. Instant screen saver function. Simply pull out your key, the screensaver function will guarantee that nobody can access your files whilst you have coffee or lunch !

7. Money back guarantee if you are not completely happy with the quality of our product. return it to us in 30 days for full refund.

ON SALE NOW

JARGON BUSTER: STORAGE

Nirmal Chandrasena helps you cut through the jargon with our monthly technology glossary.

ATA (ADVANCED TECHNOLOGY ATTACHMENT)

The name coined by ANSI (American National Standards Institute) for a popular interface used between motherboards and storage devices like hard disks and CD-ROMs called IDE. It's a parallel interface and comes in a variety of speeds including UltraATA, ATA/100 and ATA/133. Serial ATA is a different technology, but appears to the operating system as standard ATA.

CACHE

High speed temporary storage memory used for frequently accessed data. Many hard drives typically have 2MB caches, although larger caches, up to 8MB are becoming increasingly common. Most CD burners also have cache.

MEMORY CARDS

Small, non-volatile solid-state memory devices that are commonly used with portable devices such as digital cameras, MP3 players and PDAs. Popular memory cards are Secure Digital (SD), CompactFlash (CF), Memory Stick, MultiMedia Card (MMC), SmartMedia and XD cards.

FILE SYSTEMS

The structure used to organise and store information on storage devices. Hard drives are 'blank' when they leave the factory, and need to be formatted with a file system in order to hold data. Formatting a drive is similar to drawing lines and margins on a page. Windows 2000 and XP recognise FAT16, FAT32 and NTFS while Linux and Macintosh systems use ext2/3 or FAT16 and HFS, respectively.

HOLOGRAPHIC STORAGE

An experimental optical technology that stores data as three dimensional holograms rather than the simpler two-dimensional format used across other storage formats. Holographic storage uses both the surface and the depth of the stored data and by adjusting the angles and frequencies of lasers, multiple chunks of data can be overlaid in the same physical space. Read and

write speeds in holographic storage can surpass current technology, with demonstrated read speeds exceeding a billion bits per second.

IMAGING/GHOSTING

An image is a 'snapshot' of a hard drive that can be used to restore or clone a particular partition. Imaging is especially useful for restoring a PC to its original configuration or creating identical configurations of operating systems and common applications on multiple machines for large corporate desktop rollouts. Images can be applied or restored over networks and CDs, and can also be mounted using virtual drive emulators.

INFINIBAND

A serial bus specification for data flow between processors and I/O devices that is expected to gradually replace the PCI shared-bus. It supports up to 2.5GB/s throughput and connectivity for 64,000 devices.

NAS (NETWORK ATTACHED STORAGE)

A hard disk or a disk system that is attached to a network and is giving its own IP address. NAS can consist of drive space, RAID systems and configuration software, and may be part of a SAN (Storage Area Network).

OPTICAL MEDIA

Media that is read and written using lasers, commonly referring to CD (Compact Disc) and DVD (Digital Versatile Disk) technology. The surface of the media is physically indented with pits or grooves, which are read by lasers as the drive is spinning.

RAID (REDUNDANT ARRAY OF INDEPENDENT DISKS)

The method of using multiple individual hard disks to work together and appear as a single disk to improve performance, provide data redundancy, or both. RAID 0 uses striping to split data between multiple disks to improve performance. RAID 1 uses mirroring with a second hard disk to make an exact copy of everything on the first for data redundancy.

RAID 5 spreads the data across three disks to improve performance and if one disk fails, it provides redundancy as there will still be a complete set of data between the remaining two disks.

SCSI (SMALL COMPUTER SYSTEMS INTERFACE)

This is a set of relatively high-speed interfaces for components and peripherals. SCSI storage devices offer high access speeds, and are used in many enterprise storage systems. However, the technology is being phased out of desktop systems in favour of UltraATA and SATA.

SAN (STORAGE AREA NETWORK)

A sub-network that connects data storage devices and servers using fast, reliable connections. In a SAN, storage devices do not belong to any one server, but are shared as a peer resource between other servers. A SAN is accessed by users of the greater network.

SATA (SERIAL ATA)

A new hard disk communications technology, similar to ATA. It is a serial interface, rather than parallel. This allows for potentially higher speeds. The first generation of SATA devices have a maximum bandwidth of 150MB/s. It is also hot-pluggable and the cables are much smaller than ATA cables, making them easier to manage.

iSCSI (INTERNET SCSI)

The leading IP-storage standard used to facilitate block data transfers over intranets and long distances. iSCSI may be used to build SANs over any type of existing IP-network.

TAPE STORAGE

An external storage medium that once served as primary storage for many computer systems, but is now used mainly for archiving. While it appears outdated, tape is often the backup of choice due to the relatively cheap cost per megabyte and large storage capacities, although it is much slower than disk-based or CD-based storage.

LEISURE

When we need baddies battled, tombs raided and a world snooker champion, we don't call Tin Tin or James Bond – we call Des McNicholas.

DELTA FORCE: BLACK HAWK DOWN

After a promising start with the original title, the ongoing Delta Force series has received a mixed reception from gamers. In the latest release, Delta Force: Black Hawk Down, Novalogic looks set to recapture some of the early magic and attract some new fans to the franchise. Black Hawk Down is essentially an on-rail shoot-fest with a decent pace and solid graphics, loosely based on the movie of the same name. It's lots of fun and innovative enough to stand up to the competition.

Somalia proved to be a watershed for the US military, and Black Hawk Down takes players straight into the confused world of regular armed forces, militia and desperate civilians. The 16 single-player missions cover Operation Restore Hope; the frantic and well publicised action of Task Force Dagger; and the final battle of Mogadishu. Multiplay, which sadly includes no cooperative mode, is available via LAN and Novalogic's NovaWorld service. It doesn't really bring anything new to the over-supplied online community, but it runs well enough and the early indications are that it will be well-supported. All up, it's a reasonable package, even if experienced players will move through it fairly quickly.

⌚ Somali townships are suitably cluttered, with countless hiding places.

Black Hawk Down brings a good mix of mission goals and some very exciting moments. Admittedly, the missions quickly degenerate into a 'kill everything in sight' free for all, but they stand well enough on their own the first time through. Tasks range from escorting convoys to uncovering weapons caches and apprehending enemy leaders, and most of the heavily scripted missions include short notice multiple objectives. The arcade style will be seen as a step backwards by some players, but Black Hawk Down does a splendid job of maintaining pace and excitement.

Unsurprisingly, Novalogic uses a very simple control

system. The uncluttered main screen includes a stance indicator and an all-seeing radar map, and movement is via mouse and arrow keys. Players have a choice of first or third-person views, and a waypoint indicator keeps things moving. Some basic fine tuning can be done to adjust the view, and quick menus are available to issue commands. The high degree of situational awareness will probably be too much for experienced players, but newcomers will appreciate the shallow learning curve.

Black Hawk Down offers a reasonable level of difficulty in most missions, driven largely by the sheer numbers of enemies that get in the way. At times, it

seems as though the waves and waves of targets are never going to stop, things aren't helped by some fairly average AI on both sides either. NovaLogic has included some rudimentary team commands, but you're generally on your own in the single player game. In particular, friendly forces can't seem to shoot straight, and their path finding skills are a little less than you would expect from America's Special Forces. The enemy isn't any better, which tends to balance things out nicely!

Despite lacking the depth of some recent titles, Black Hawk Down does provide top-flight environments and intense action. Using essentially the same graphics engine as the impressive Comanche series, Novalogic has re-created the atmosphere of Somalian villages and townships very well, and the transition from helicopter to foot soldier is marked by a free-flowing feel and excellent pacing. Delta Force: Black Hawk Down is no Medal of Honor, but it's cheaper, and still a lot of fun.

V8 SUPERCARS AUSTRALIA: RACE DRIVER

It's always great to see an Australian connection in games, and V8 Supercars Australia: Race Driver has more 'mates' and 'g'days' than you can poke a didgeridoo at. Officially licensed by the Australian Vee-Eight Supercar Company (AVESCO), Codemasters' Race Driver brings the very successful PS2 title to the PC. Despite the Australian tag, the game lets drivers try their skills on 31 of the world's big circuits, including Silverstone and Hockenheim, and race it out in 13 official championships.

REQUIREMENTS: 700MHz, 128MB RAM, 1.5GB hard disk, 32MB DirectX video card
SUPPLIER: Atari
PRICE: \$89.95
OVERALL ... 1 2 3 4 5 6

Bathurst, Phillip Island and five other Australian tracks are all modelled in exceptional detail, along with 42 cars and 23 Ford and Holden drivers from the V8 Supercar Championship Series.

Race Driver looks outstanding on the PC, boasting terrific levels of track realism, excellent car models and first-rate environmental effects. Remarkably, the on-track experience scrubs up even better than the excellent PS2 version; and the addition of very stable (after a small patch) multiplayer via LAN or Internet should attract rev-heads everywhere. The console-style storyline (including email-based race offers) slows things down a little, but it's a small price to pay for a very solid driving experience and a decent mix of

configuration options. Race Driver is nicely balanced to suit experts and novices alike, with gear ratios, spoilers, suspension and brake bias all available tuning.

Race Driver's career progression and championship system work very nicely, providing plenty of pre-race information. Driver specs and players' overall ratings can be accessed as needed, and a competitive atmosphere quickly sets in. The alternative Free Race mode brings the chance to race any circuit or custom design a championship, and the Time Trial feature includes a

⤴ Everyone else seems to be facing the wrong way except me!

constantly updated 'ghost car' – just stay in front of it. Aside from the console-style feel to be expected from a port, and occasional clipping problems, V8 Supercars Australia: Race Driver is a strong PC title that does a better job of capturing the V8 experience than its predecessors. No worries mate!

➤ www.codemasters.com

RISE OF NATIONS

This was another game we had a sneak preview of recently (*May 2003, page 140*), and things have shaped up very nicely indeed. Rise of Nations, from Big Huge Games and Microsoft, adds a little spice to the RTS genre, with fast-paced missions, a terrific mix of civilisations and units, and well-balanced RTS and strategic elements. With 18 civilisations, 6,000 years of history, and the chance to pit jet fighters against black powder cannon, Rise of Nations has enough to keep hardened RTS veterans and newcomers happy. The single-

REQUIREMENTS: 500MHz CPU; 128MB RAM; 800MB hard disk; 16MB DirectX video card
SUPPLIER: Microsoft
PRICE: \$99.95
OVERALL ... 1 2 3 4 5 6

player game is supported by eight-player multiplayer via Internet or LAN, and the comprehensive scenario editor brings extensive replay value.

Rise of Nations matches the traditional RTS goals of finding resources and building an economy, with the interesting twists of controlling several cities at once and planning world-dominating strategies in the optional Conquer the World mode. National boundaries are shown on-screen, and crossing them without the proper precautions comes at the cost of sick troops and probable defeat. The result is a stronger emphasis on national development in the early stages of the game, and players should enjoy the move away from tank rushes and random assaults. The construction and research

interfaces are well designed, and plenty of on-screen tips are available to set things in the right direction and warn of disaster.

Big Huge Games has introduced an exceptionally good level or 'epoch' system that brings a much greater sense of pace and achievement than most RTS titles. Its claim that players can span the whole of history in less than an hour isn't far off the mark, which adds remarkable intensity to both the single and multiplayer experiences. The chance of catching an industrial age opponent out with information age technology is too good to resist, and the smart economic AI means that players have the

⤴ Rise of Nations looks great, and the on-screen interface is tidy and intuitive to use.

opportunity to concentrate on advancing through the ages as quickly as possible. Rise of Nations isn't the 'new epoch' in PC games claimed by Microsoft, but it's a great RTS that successfully brings together the cerebral elements of turn-based civ-builders with a real-time strategy pace.

➤ www.microsoft.com/games

MEDIEVAL TOTAL WAR: VIKING INVASION EXPANSION

We provided a quick preview of Creative Assembly's Viking Invasion a couple of months ago, and the final product certainly lives up to our high expectations. The Total War series still leads the field in historical strategy gaming, and Viking Invasion brings a host of new elements improving significantly on the original game. A new campaign set in 793 A.D. lies at the heart of the expansion, tracing the period in which the Vikings spread fear and destruction throughout Europe. The campaign is well structured, with new playable factions, units and equipment.

Viking Invasion introduces an

improved pre-battle setup option that's compatible with the original campaigns.

It's a shame that no obvious improvements have been made to the game's strategic or multiplayer elements, but no-one will be disappointed with the value offered by this expansion. Medieval Total War: Viking Invasion builds on and improves a terrific game – this is a must-have release for veterans of the original, and newcomers to the genre could do no better than buying both.

www.totalwar.com

PRICE: \$49.95
OVERALL ... 1 2 3 4 5 6

VIETCONG

The Vietnam War is a surprisingly untapped FPS environment, although a small flurry of titles are now under development. Illusion Softworks' Vietcong brings well-crafted jungle settings, real-world characters and a (generally) tense atmosphere that gives it a very different feel to the sci-fi or WWII titles we're used to. Sergeant First Class Steve Hawkins leads the way against the VC, through a good mix of 20 missions; a frantic Quick Fight Mode; and basic multiplay via LAN and Internet. It's a very good package overall, despite a few minor presentation glitches and a fairly superficial squad control setup.

Vietcong's key advantage undoubtedly lies in strong AI that takes maximum advantage of the close-in jungle terrain and generally avoids the traditional FPS frontal assaults. The relatively limited range of weapons are more than enough in most environments; some of the sounds and effects are outstanding; and the option to switch off all player aids makes for terrifically tense patrols. It needs a patch to address some technical issues, but Vietcong is a refreshing title in a genre that needs a boost.

SUPPLIER: Take 2 Interactive
PRICE: \$89.95
OVERALL ... 1 2 3 4 5 6

1503 A.D. THE NEW WORLD

Sunflowers had a reasonable hit with the empire-building 1602 A.D. a few years ago, despite launching into a market that was flooded with strategy titles. 1503 A.D. The New World is essentially more of the same, but the relatively dated graphics and cumbersome interface will probably lessen interest this time around. Consisting of a twelve mission campaign, single missions and a 'continuous' (sandbox) mode, 1505 A.D. brings decent replay value and a good mix of objectives – although the lack of multi-play is a little surprising.

The usual management aspects are supplemented by a

strong seaborne trading element, which works very well, and a comprehensive range of construction options are available. An AI balancing system means that rival states will only get aggressive in response to players' actions, so players can choose to concentrate on construction and the economy for as long as they like. It can be a bit slow, but 1503 A.D. The New World is a reasonable strategy title that covers an interesting historical period.

www.1503ad.com

SUPPLIER: Electronic Arts
PRICE: \$99.95
OVERALL ... 1 2 3 4 5 6

WILL ROCK

Will Rock, from Russian developer Saber Interactive, is a fun shooter in the Serious Sam style. The storyline – which includes imprisoned Greek gods and terrorists – is largely unimportant, as players fight their way past skeletons, statues and sodded-off deities through a maze of well-crafted environments. Will Rock's intense single player campaign is complemented by well-supported multiplayer options, and Saber has thrown in some very interesting (and messy!) weapons. The pacing is a little hit and miss, with things jumping between explosives-ridden mayhem and some

fairly dull puzzle elements, but the overall experience is good.

What Will Rock's enemies lack in AI, they more than make up for in sheer numbers and a remarkable ability to appear out of nowhere. Fortunately, Will's initial pistol and shovel are soon replaced by flaming crossbows and atomic rifles.

It's a basic shooter at heart, but Will Rock neatly balances traditional FPS gameplay with some innovative environments, impressive special effects, and a good sense of humour.

THE NEW AND INEXPENSIVE WAY TO PRODUCE PDF FILES

Thanks to Manacomm we have ten copies of PublishPDF Pro to give away to ten lucky readers!

PublishPDF Pro software lets you convert virtually any document (from Microsoft Word to complex graphs) to the popular Portable Document Format (PDF) and feel confident anyone using virtually any computer can read and print the PDF file.

A PDF file preserves the format of the original document, and contains all the original fonts, images & graphic information, layout and formatting – so what you see is exactly what everyone else sees.

With PublishPDF Pro you can:

- Combine multiple documents into a single PDF
- Embed fonts – ensures the original fonts are used, on any computer
- Send PDFs via email – simply send the email from within PublishPDF using your email program
- Create PDFs in Microsoft Office – increase your productivity and efficiency at work
- Preview before saving – guarantee your PDF is exactly how you want it
- Compress files to a fraction of their original size – perfect for emailing and for Web downloading
- Convert unlimited paper documents to PDF files – for easy archiving and reference
- Share your document with almost anyone – more than 500 million copies of Adobe Acrobat Reader have been distributed around the world
- Use password controlled 128-bit encryption to protect your documents from unauthorized access or alterations

For more information about PublishPDF Pro, check out:
www.manac.com.au
 or call: 1300 728 606

Terms and Conditions of Entry. 1. The promoter is AJB Publishing (ACN 083 063 914) of 2/5 44-70 Rosehill Street, Redfern NSW 2016. Promotion period is from 9.00am on 11.6.03 until 5.00pm on 09.07.03. 2. Entry is open to residents of Australia and New Zealand. Management and employees of AJB Publishing Pty Ltd, and their immediate families, and any advertising, marketing or promotional firms associated with this promotion are not eligible to enter. 3. Entry is by posting or emailing forms to AJB Publishing. 4. The draw will be held at the offices of AJB Publishing at 5.00pm on 09.07.03. Winners will be notified by mail and published in PC Authority. 5. The prizes are not transferable or exchangeable and cannot be taken as cash. 6. The judges' decision is final and no correspondence will be entered into. 7. The promoter reserves the right to publish the winner's name and suburb for promotional purposes. 8. All entries will become the property of AJB Publishing Pty Ltd. 9. AJB Publishing and Manacomm may use the entrants' names for promotional purposes, i.e. to update the entrants on upcoming or newly announced products. If you do not wish to receive this information, please write 'Don't Subscribe' within the body of the email or the entry form. AJB Publishing respects your privacy.

QUALITY PHOTOGRAPHIC
PRINTS NOW IN
THE COMFORT OF YOUR
OWN HOME.

INTRODUCING YOUR PERSONAL HOME PHOTO LAB - The 6-colour EPSON STYLUS Photo 830U. It makes printing beautiful photo-quality images at home a breeze. And best of all, you have the versatility to print black and white to full vibrant colour and everything in between, like brochures and newsletters to your favourite happy snaps. Plus, printing from home means you get to choose to print only the images you want. Of course, EPSON products aren't complete without cutting edge technology - 5760 optimised dpi using Resolution Performance Management Technology, PRINT Image Matching II and PerfectPicture Imaging System just to name a few of EPSON's pioneering technologies. The EPSON STYLUS Photo 830U, it's more than an inkjet, it's a photo lab you can take home. Phone 1800 652 726 or visit www.epson.com.au.
